How to Log In to the Platform

If you already have an account and password, visit the MaiAgent AI Assistant Platform login page:

<https://admin.maiagent.ai/login>

Enter your account and password to log in and start using the platform.

Forgot Password

If you forgot your login password, click **"Forgot Password?"** to reset it.

1. Click the Forgot Password Button

2. Enter Your Registered Email

3. Check Your Email for the Password Reset Email and Click the "Reset Password" Button

4. Set Your New Password

MaiGPT Overview

What is MaiGPT?

MaiGPT is your company's dedicated AI chat assistant. You can talk to it just like ChatGPT, but it can also query your company's internal data, connect to your work tools, and all conversations stay within the company — nothing leaks out.

Overview: MaiGPT Feature Modules

MaiGPT six major feature modules overview

MaiGPT six major feature modules overview

AI chat is the core experience — choose a model, upload files, and ask questions directly. Other features extend the chat capabilities: Canvas lets you edit AI-generated documents in real time, Deep Research has AI automatically search the web to produce comprehensive reports, AI Image Generation lets you describe visuals with text, and Connectors let AI access your work tools like Notion and Slack.

Six Features at a Glance

Feature	What It Does	Typical Use Cases
<u>AI Chat</u>	Multi-model conversation with file uploads, knowledge base Q&A, and web search	Daily Q&A, document analysis, translation
<u>Canvas</u>	Edit AI-generated long-form content in real time	Writing reports, emails, proposals, creating charts
<u>Deep Research</u>	AI automatically searches the web to produce structured research reports	Market research, competitive analysis, topic research
<u>AI Image Generation</u>	Generate images from text descriptions with iterative editing	Marketing materials, presentation illustrations, concept visualization
<u>Connectors</u>	Connect external work tools so AI can query them directly	Search Notion notes, find Slack messages, locate Google Drive files
<u>Multi-Device Access</u>	Web, iOS App, LINE, Microsoft Teams	Use MaiGPT anytime, anywhere

How Is It Different from Agent Builder?

MaiGPT vs Agent Builder use case comparison

MaiGPT vs Agent Builder: positioning, audience, use cases, and operation at a glance

	MaiGPT	Agent Builder
Audience	All company employees	IT admins Developers
Purpose	Chat directly with AI to get daily work done	Build AI assistants for customers or internal use
How to Use	Just type, like ChatGPT	Configure role instructions, knowledge bases, tools, and other modules

Quick rule of thumb: Want to use AI yourself → MaiGPT; Want to build AI assistants for others → Agent Builder.

Recommended Getting Started Order

If this is your first time using MaiGPT, follow this order to get started:

```
Step 1 → Start a conversation – pick an AI model and ask a question
Step 2 → Try uploading a file – let AI analyze the document for you
Step 3 → Use Canvas – ask AI to write a report or email for you
Step 4 → Expand as needed: connect Notion
        Slack, use Deep Research
```

You don't need to learn everything at once. Start with chat + file uploads, then gradually explore advanced features.

Still Have Questions?

FAQ — Answers about usage limits, model selection, security, and privacy

Create Documents and Spreadsheets from Templates

The **Document** and **Spreadsheet** shortcuts on the MaiGPT home page let you select a template and data sources before returning to the conversation and asking AI to generate content. Documents work well for reports, summaries, and proposals, while spreadsheets are ideal for organizing data into fields and rows.

Filter document templates by source and category, then add a knowledge base, skill, or database below

The spreadsheet shortcut provides built-in templates such as Gantt charts, dashboards, registers, and spreadsheets

Use Case

Project manager Mai needs to prepare a weekly progress report. She selects the weekly report template under **Document**, adds the project knowledge base, and applies the template. MaiGPT brings the template and selected data sources into the conversation, where she can specify the scope for the week and generate a draft.

Create a Document or Spreadsheet

Choose a Document or Spreadsheet

In the **Productivity** section of the MaiGPT home page, select **Document** or **Spreadsheet**.

Find a Template

Use search, source, or category filters to find a suitable template. You can also select the star icon to add frequently used templates to **Favorites**.

Organization templates are provided by your company, while **Built-in** templates are included with MaiGPT. The templates displayed depend on your organization's settings.

Add Data Sources

At the bottom of the panel, select the **knowledge bases**, **skills**, or **databases** to reference. Add only the sources needed for the content to keep the subsequent conversation focused.

Apply the Template and Describe Your Request

Select a template, then click **Apply**. The selected template appears above the input box, which is also prefilled with prompt text. Close the template panel, add the time period, audience, output tone, or required fields to your message, and submit the generation request.

When generation is complete, MaiGPT lists a summary of the results and the generated files in its response. Review the content, then click **Download** to get the document or spreadsheet.

已完成「星河茶坊」2026 年 9 月第 2 週週報，並套用週進度報告範本。

內容包含：

- 本週完成：官網改版
- 下週計畫：進行會員測試
- 主要風險：測試樣本不足

下載週進度報告 DOCX

已產出 1 個檔案

	xinghe_tea_weekly_report_2026-09-week2.docx	 下載
815.8 KB · 已依照「週進度報告」範本建立星河茶坊 2026 年 9 月第 2 週週報。		

MaiGPT displays the weekly report summary, generated file name, and download button

The workflow is the same for spreadsheets. The following example uses the **Project Schedule Gantt Chart** template to generate an Excel file from three fictitious work items. When it is ready, review the item summary, file name, and file size in the response, then download the **.xlsx** file.

The spreadsheet result lists three work items and provides an Excel file for download

Manage Your Own Templates

Select **Import Document Template** or **Import Spreadsheet Template** in the upper-right corner of the panel to add custom templates permitted by your organization. Imported templates appear in the template list and can be reused later.

If the data source list is empty, first confirm that you have access to the relevant knowledge base, skill, or database, then contact your organization administrator for assistance.

AI Chat

AI Chat is the core experience of MaiGPT. Select an AI model, type your question, and get an answer. You can also upload files for AI analysis, query your company knowledge base, search the web in real time, and enable deep thinking to tackle complex problems.

Chat Capabilities Overview

Capability	What It Does	Best For
Select AI Model	Switch between different models (Claude, GPT, Gemini)	Choosing the best AI for your task
Upload Files & Images	Upload documents for AI to read, summarize, and analyze	Contract review, report analysis, image recognition
Knowledge Base Q&A	Query your company's internal knowledge base	Company policies, product manuals, SOPs
Web Search	Search the web in real time for the latest information	News, market trends, competitor intelligence
Deep Thinking	AI reasons before answering, ideal for complex questions	Multi-step analysis, logical reasoning, decision-making
Chat Memory	Remembers conversation context and your preferences	Continuing discussions, long-term collaboration
Share Conversations	Share an entire conversation with members of your organization so they can view it or copy it and continue asking questions	Sharing results, continuing work
<u>Conversation Handoff</u>	Summarize a long conversation for handoff and continue in a new conversation	Long-running discussions, high context usage

Quick Start

Type your question — Enter your question in the input box and press Enter to send

Upload a file — Click the paperclip icon or drag and drop a file directly

Switch models — Click the model name at the top and select a different AI

Not sure where to start? Just type your question. The AI will automatically respond based on your input — no setup required.

Select AI Model

MaiGPT includes multiple built-in AI models that you can freely switch between based on your task. Each model has its own strengths, and choosing the right one helps you get better answers.

How to Switch Models

Click the model name at the top of the chat area, then select your desired model from the dropdown menu.

Click the model name at the top to open the dropdown and switch AI models

After switching, all subsequent responses will use the new model. Your previous chat history remains unaffected.

How to Choose a Model

My Task	Recommended Model	Reason
Writing reports, analyzing documents	Claude	Strong Chinese comprehension, excels at long-form writing
Code, technical questions	Claude GPT	Both excel here — try both and compare
Quick Q&A, translation	Gemini	Faster response times
Creative ideation, brainstorming	Claude GPT	Better creative quality
Need the latest information	Pair with web search	Any model works

Not sure which to pick? Start with the default model. If you're not satisfied with the response quality, try switching to another model and asking the same question to compare which answer better meets your needs.

FAQ

Will my previous conversation disappear after switching models?

No. Your chat history is fully preserved — only subsequent responses will be generated by the new model.

Why can't I see certain models?

Available models are configured by your company administrator. If you need access to a specific model, contact your IT admin.

Do different models cost the same?

Different models have different usage calculations, but this is typically managed by your company, so you don't need to worry about costs.

Upload Files & Images

You can send files or images to MaiGPT and let the AI read, summarize, analyze, or translate them for you.

How to Upload

There are two ways:

Click the paperclip icon — Located next to the input box, click it to select files

Drag and drop — Drag files from your desktop into the chat area

After uploading, the file will appear above the input box. Then type your question and press Enter to send.

Supported Formats

Type	Formats
Documents	PDF, Word (.docx), Excel (.xlsx), PowerPoint (.pptx), TXT
Images	PNG, JPG, GIF
Other	CSV, JSON, Markdown

What You Can Do

Uploaded Content	What You Can Ask AI
A contract PDF	"What clauses in this contract are unfavorable to us?"
An Excel report	"Summarize the key trends in this report"
A product image	"What are the product specifications in this image?"
A meeting presentation	"List the three key takeaways from this presentation"
An English document	"Translate this into Traditional Chinese"

Tips

Upload multiple files at once You can select and upload multiple files at the same time, and the AI will analyze them together. For example, upload three quotes and ask "Compare the differences between these three quotes."

File size limits The size limits for documents and audio files in a chat depend on your company's settings; the current default is 10 MB. Images have a separate limit. If a file exceeds the limit, MaiGPT displays the next steps instead of uploading it directly.

When File Content Cannot Be Read

For example, a project manager wants to summarize a PDF sent by a partner, but the file was corrupted during transmission. She clicks **Add** → **Upload File**, selects the file, and enters a request for a summary. If the system cannot read the content, the response may explain that it cannot provide a summary and ask her to upload the file again. When she sees this type of message, she can first confirm that the original file opens normally, then obtain the complete file and upload it again.

In this verification, MaiGPT explained that it could not summarize the file and asked the user to upload it again.

If parsing fails, first open the original file on your computer to confirm that it is not corrupted and that its content is complete. Then download it again or ask the sender to resend it. Do not use the file name as the basis for a summary. After uploading the file again, verify that the response is actually based on the file's content.

What to Do If a File Exceeds the Limit

For example, project manager Mai wants MaiGPT to summarize an 11 MB fictional company report. After selecting the file, a message indicates that it exceeds the 10 MB limit. Mai can then upload and attach the file through a knowledge base before returning to the chat to continue asking questions.

When a file exceeds the chat limit, follow the on-screen instructions to process it through a knowledge base

Confirm the file name and current size limit in the notification window.

If you have permission to use knowledge bases, click [Go to Knowledge Base](#). Create or open a knowledge base, upload the file, and wait for processing to finish.

In the knowledge base's [Linked AI Assistant](#) settings, link the knowledge base to the MaiGPT assistant you want to use. Return to [AI Chat](#), click [Select Knowledge Base](#), select the knowledge base you just used, and then enter the question you want MaiGPT to process.

The instructions above apply to the MaiGPT admin web interface. Web Chat end users do not have access to knowledge bases. If [Go to Knowledge Base](#) is not displayed, contact your organization administrator and ask them to add the file to the assistant's knowledge base. Alternatively, paste the sections you need analyzed, or split the file into smaller files and upload them again. Audio files are more likely to reach the limit, so try compressing them first.

Knowledge Base Q&A

MaiGPT can connect to your company's knowledge base, allowing you to query internal company data through natural conversation. AI responses include source references that you can click to view the original documents.

How to Use

Just ask your question. If your MaiGPT is connected to a company knowledge base, the AI will automatically search for relevant information to answer your question.

"What is the company's leave request process?"

"What are the differences between Product A and Product B?"

"What should new employees do on their first day?"

After selecting a knowledge base and asking a question, the AI uses the query_files tool to search the knowledge base and return results

Answers Include Sources

AI responses indicate data sources, typically displayed as citation markers or links. Click them to view the relevant sections of the original document.

This allows you to:

- **Verify answer accuracy** — See which document the AI based its answer on
- **Dive deeper** — If the summary isn't enough, click through to read the full original text

Can't Find an Answer?

If the AI responds with "I couldn't find relevant information in the knowledge base," it may be because:

Situation	What to Do
The data hasn't been uploaded to the knowledge base yet	Contact your admin to upload the relevant documents
Your question is too vague	Try asking with more specific keywords
Knowledge base access restrictions	You may not have access permissions for that data — contact your admin

"Not found" doesn't mean the company doesn't have the data Knowledge base content is uploaded and maintained by administrators. If you're sure certain data exists but the AI can't find it, notify your admin to confirm whether it has been imported into the knowledge base.

Web Search

MaiGPT can search the web in real time to get the latest information for answering your questions. It's ideal for queries about news, market trends, competitor intelligence, and other scenarios that require up-to-date data.

How to Use

Click the web search button next to the input box, or mention that you need the latest information in your question:

- "Search for today's Taiwan stock market closing price"
- "What are the recent AI-related regulatory updates?"
- "Look up what new products competitor X has recently launched"

After using the Web Search Tool to search web sources, the AI compiles and responds with results and source links

The AI automatically searches multiple websites, compiles the findings into a comprehensive answer, and includes source links.

When to Use Web Search

Good For	Not Needed
Latest news and current events	Company internal data (use the knowledge base)
Product prices and specifications	Writing reports, translation (no external data needed)
Regulatory and policy updates	Analyzing uploaded files
Market trend research	Casual conversation, brainstorming

Web Search vs Deep Research Web search is great for quickly looking up a single question — you get answers in seconds. If you need to deeply research a topic and produce a comprehensive report, use Deep Research.

Deep Thinking

Deep Thinking lets the AI "think it through" before answering, making it ideal for complex questions that require reasoning, analysis, or multi-step judgment. When enabled, you can see the AI's thinking process.

How to Use

Click the Deep Thinking button next to the input box to enable it, then ask your question as usual.

The AI response will have two parts:

Thinking process (expandable/collapsible) — Shows how the AI analyzed your question

Final answer — The complete response after reasoning

When to Enable

Good to Enable	Not Needed
Complex analysis and comparisons	Simple Q&A ("What's the weather today")
Logical reasoning required	Translation
Math calculations, data analysis	Casual conversation
Multi-faceted decision-making	Text polishing, rewriting

Deep Thinking takes longer Because the AI needs to think before answering, response times are slower than normal mode. If your question isn't complex, stick with the standard mode.

Chat Memory

MaiGPT remembers your conversation content, allowing you to continue previous discussions without re-explaining the background every time.

Two Types of Memory

Conversation Memory (Short-Term)

Within the same conversation, the AI remembers everything discussed earlier. You can continue the discussion seamlessly:

You: "Summarize the key Q1 performance highlights for me"

AI: (responds with the summary)

You: "Now add a Q2 comparison" ← The AI knows you're talking about performance

Starting a new conversation clears the short-term memory, and the AI starts fresh.

Long-Term Memory

MaiGPT can remember important information across conversations, such as your role, preferences, and frequently used formats.

You: "Remember that I'm in the marketing department, and I always want reports in bullet-point format"

AI: Got it, I'll remember that.

Even in new conversations afterward, the AI will remember these preferences.

Tips

Make the most of a single conversation If you're working on a topic (such as writing a report), try to complete it within the same conversation. This way the AI retains all the context, resulting in better responses.

Need a fresh start? If you want to switch to a completely different topic, start a new conversation to prevent content from the previous topic from influencing responses on the new one.

Organize Conversations: Pin Frequently Used Chats

As your conversations pile up, important or frequently used ones get pushed down by newer chats and become hard to find. You can "pin" them to keep them fixed at the top of your "Chat History" for one-click access anytime.

How to Pin

In the "Chat History" panel on the left, hover your mouse over the conversation you want to pin
Click the  menu that appears on the right

Select **Pin**

Hover over a conversation and click the  menu to see the "Pin" option

Once pinned, the conversation moves to the **Pinned** section at the top of "Chat History," with a  icon next to its title.

Pinned conversations are grouped at the top in the "Pinned" section, while regular conversations are sorted by time below

Unpin

Click the  menu on a pinned conversation and select **Unpin**. The conversation will return to the regular time-sorted list below.

Sorting & Rules

Item	Description
Sort order	Both the Pinned section and the regular list are sorted by the time of the last message, from newest to oldest — regardless of when pinning occurred
Pin limit	There is no limit — you can pin multiple conversations at the same time
Persistence	Pin status is saved and persists after refreshing or logging in again

Item	Description
Collapse section	Click the "Pinned" header to expand or collapse the entire section
Scope	You can only pin your own conversations

Good Scenarios for Pinning

Finance

Banking: Pin reconciliation chats or financial plan comparison conversations you regularly track

Tech

Electronics Manufacturing: Pin frequently referenced product spec or technical troubleshooting conversations

Educational Institutions: Pin recurring admissions Q&A or curriculum planning discussions

Service

Retail: Pin ongoing campaign planning or membership benefits inquiry conversations

Or any workflow you return to and continue every day

Pinning only affects your own view Pinning is a personal organization method — it only changes the sort order you see in "Chat History." It does not affect other team members, nor does it alter the conversation content itself.

Share Conversations

You can share an entire conversation with members of your organization. Anyone with access can open the link to view the full conversation. If you allow copying, they can also copy it to their own conversation list with one click and continue asking questions.

Use Case

A knowledge base administrator uses MaiGPT to compile a "Frequently Asked Questions for New Employees" conversation and wants everyone in the organization to use it. At the top of the conversation, they click **Share** and select **Quick Share with Entire Organization**. The link is immediately copied to the clipboard and can be pasted into an announcement. Members can open the link to view the entire conversation. To ask follow-up questions about their own situation, they can click **Continue Conversation** to copy it to their conversation list and keep chatting without affecting the original conversation.

How to Share

The share option appears at the top of the conversation page only after the current conversation contains at least one message.

1. Click "Share"

Click **Share** at the top of the conversation page to display two options:

- Quick Share with Entire Organization**: Immediately generates a link and copies it to the clipboard. Everyone in the organization can view and copy the conversation, with no additional settings required.
- Customize Sharing Scope**: Choose the recipients and permissions yourself, as described in the next step.

The Share button provides two options: Quick Share with Entire Organization and Customize Sharing Scope

2. Set the Sharing Scope and Permissions

After selecting **Customize Sharing Scope**, configure the following in the dialog:

Field	Description
Sharing Scope	Choose Everyone in Organization , Specific Groups , or Specific Members . For groups or members, use the selection field below to select one or more recipients

Field	Description
Share Title	Optional. The title recipients see on the shared page and in the Browse Organization Shares list. If left blank, the conversation title is used
Description	Optional. Briefly describe the conversation's key points or purpose
Sharing Permission	Can Copy (default) lets recipients copy the conversation to their own list and continue asking questions. Read Only lets recipients view it only

Set the sharing scope, title, description, and permissions in the same dialog

3. Generate and Send the Link

Click **Generate Share Link**. The link is automatically copied to the clipboard, and you can click **Copy Link** to copy it again. Send the link to the recipients. They must sign in to MaiAgent to open it.

The link is copied automatically when generated, and you can click Copy Link to copy it again

What Recipients See

After signing in and opening the link, recipients arrive at the shared page. The title, sharer, sharing time, and message count appear at the top, with the entire conversation below. They can view the content but cannot type on this page.

When permission is set to **Can Copy**, a **Continue Conversation** button appears at the bottom. Clicking it copies the conversation into a new conversation owned by the recipient, displays "Copied to your conversation list!", and automatically opens it so they can continue asking questions.

When permission is set to **Read Only**, the page displays "This conversation is shared as read-only" and does not show a copy button.

Members outside the sharing scope, or accounts from another organization, see "Unable to load this shared conversation. The link may no longer be valid."

A shared page with Can Copy permission has a Continue Conversation button at the bottom; click it to copy the conversation to your own list

The copy is a new conversation After clicking **Continue Conversation**, the recipient continues in a new conversation under their own account. Your original conversation is unchanged, and you cannot see their subsequent messages. The two conversations remain independent.

Browse Organization Shares and Manage My Shares

Browse Organization Shares at the top of the conversation page lists all shares in the organization that you are allowed to view. Search by title or description, then click **View** to open a shared page.

On this page, click **My Shares** to manage every conversation you have shared:

Action	Description
Edit	Change the share title, description, and sharing permission. The sharing scope and recipients cannot be changed after creation. To change recipients, cancel the share and create a new one
Copy Link	Copy the same share link again
Cancel Sharing	After cancellation, others who open the link see that it cannot be loaded. Conversations already copied to their own lists are unaffected

Use My Shares to edit a share, copy its link, or cancel sharing

Sharing Rules

Item	Description
Shared content	The share captures the content at the moment you click Share. Messages subsequently added to the original conversation do not appear on the shared page. Create a new share to share newer content
Excluded content	The AI's thinking process and tool execution records do not appear on the shared page. Only the conversation text, code, and Canvas content are included
Who can open it	Only signed-in members of the same organization. When the scope is limited to groups or members, anyone not selected cannot open it
Expiration	There is no expiration date. The share remains available until you cancel it
After the original conversation is deleted	The shared page remains available to view and copy, preserving the version captured when it was shared
Who can manage it	Only the person who created the share can edit or cancel it

Review Earlier Content While a Response Is Being Generated

While MaiGPT is generating a long response, you can scroll up to review earlier content. The page stays where you scrolled instead of being pulled back down as new text appears. When you scroll **above the latest question**, a white **Back to Latest** pill appears above the input box. Click it to return to the latest question and resume automatic scrolling.

Use Case

A customer service manager asks MaiGPT to compile a very long training checklist. While the AI is still writing, she wants to review the requirements she provided in the previous turn, so she scrolls up. The screen stays at the section she wants to read without being pushed down by newly generated text, and **Back to latest** appears above the input box. After checking the requirements, she clicks the pill to return to the position of her latest prompt and continues watching MaiGPT finish the rest of the response.

How to use it

1. Scroll up

While MaiGPT is generating a response, scroll up using the mouse wheel, a touch gesture, or the scroll bar.

2. Read in place

The screen stays at the position you scrolled to, and newly generated content does not move your current position. When you scroll above the latest prompt, **Back to latest** appears above the input box.

After you scroll above the latest prompt, “Back to latest” appears above the input box. Click it to return to the position of that prompt.

3. Return to the latest content

Click **Back to latest** to return to the position of the latest prompt and resume automatically following new content. You can also scroll back down to the bottom to resume following the response.

Back to latest appears only when you are above the latest prompt. If you scroll down within the same long response to read content that has already been generated, the screen also stays in place, but the pill does not appear. Scroll to the bottom to resume following the latest progress.

[Return to the MaiGPT overview](#)

Conversation Handoff

The longer a conversation goes on, the more information the assistant has to keep track of. As the conversation approaches its limit, the assistant may start losing track of the earliest parts.

Conversation Handoff lets you ask the assistant to organize your progress into a **handoff summary** at that point, then continue in a new conversation with one click. The assistant in the new conversation reads the summary first, so you do not need to explain the background again. The original conversation remains available for you to revisit at any time.

Conversation Handoff is available only after MaiAgent enables the system-wide Conversation Handoff feature. This global switch is not in the admin console; customer administrators cannot enable it themselves and must contact MaiAgent. Once enabled globally, Conversation Handoff is available in MaiGPT, Web Chat, and Ask AI in the admin console. For Web Chat, an administrator must also turn on “Enable Conversation Handoff” for the conversation platform (see [Enable it in Web Chat](#)). Other conversation platforms, including LINE, Facebook Messenger, and Microsoft Teams, are not supported.

Example

A marketing specialist is planning a fall product launch in MaiGPT. She and the assistant have discussed the venue, guest count, budget, and descriptions for two featured products all afternoon. She notices that “Context usage” below the input box has reached 82%, and a prompt above the input box suggests preparing a handoff.

She selects “Prepare handoff.” The assistant creates a handoff summary covering the event goals, chosen venue and budget, descriptions still in progress, and remaining tasks. After reviewing it, she selects “Continue in new conversation.” The view switches to a new conversation, where the assistant first says, “Continued. The remaining tasks are…” She can immediately ask it to write invitations without pasting in the earlier discussion.

Where it is available

Entry point	Who uses it	Description
MaiGPT	Organization members	MaiGPT's conversation page. The steps are the same in every layout. It is available once the global Conversation Handoff feature is enabled; no additional platform switch is needed
Web Chat	Website visitors and organization members	The Web Chat window embedded on a website. Visitors who are not logged in can use it too. After the global feature is enabled, an administrator must also turn on “Enable Conversation Handoff” for that conversation platform (off by default)
Ask AI	Admin console users	The Ask AI conversation panel in the top bar of the admin console

Web Chat assistants must use Agent mode. The assistant creates the handoff summary. If an assistant connected to Web Chat does not use Agent mode (or Agent Teams), it cannot create a handoff summary. MaiGPT and Ask AI are unaffected.

Enable it in Web Chat

Conversation Handoff and context usage in Web Chat have **two independent switches**. Both belong to each conversation platform and are off by default. Until an administrator enables them for an externally embedded Web Chat, visitors see neither handoff prompts nor context usage. “Show context usage” takes effect as soon as it is enabled. “Enable Conversation Handoff” works only when MaiAgent has enabled the global Conversation Handoff feature.

A customer support manager at an online store notices that visitors often ask about several orders in one conversation, until the assistant loses track of an order number mentioned at the beginning. She first wants visitors to see how much conversation space they have used. She opens **Feature Settings** for the store's Web Chat platform, enables only **Show Context Usage**, and saves. After visitors reopen the chat window and receive the assistant's first reply, “Context usage” and a percentage appear below the input box.

1. Open the conversation platform's feature settings

In the admin console, go to **Customer Conversations** → **Conversation Platforms**. Edit the Web Chat platform you want to configure, then select **Feature Settings** in the left menu.

2. Turn on the required switches and save

The “Basic Features” section has two switches. You can enable either one or both:

Switch	Effect in Web Chat when enabled
Enable Conversation Handoff	When the global Conversation Handoff feature is enabled, a handoff prompt appears when context usage reaches 80%. The assistant can create a handoff summary card, and visitors can continue in a new conversation. If the global feature is off, this switch has no visible effect
Show Context Usage	Shows the context usage percentage below the input box

After configuring the switches, select [Save](#).

“Feature Settings” → “Basic Features” → “Enable Conversation Handoff” and “Show Context Usage”

The two switches are independent: If you enable only “Show Context Usage,” visitors see the percentage but no handoff prompt. If you enable only “Enable Conversation Handoff,” the usage percentage does not appear below the input box, but the handoff prompt still appears at the 80%, 90%, and 100% thresholds (provided the global feature is enabled). A global switch also controls Conversation Handoff: MaiAgent controls the global Conversation Handoff switch. It is not available in the admin console, and customer administrators must contact MaiAgent to enable it. When the global switch is off, handoff is unavailable on every platform (including MaiGPT), even if “Enable Conversation Handoff” is on. “Show Context Usage” is unaffected by the global switch. The settings page for internal platforms does not show these two switches. For their position on the settings page, see [Feature Settings](#).

View context usage

A “[Context Usage](#)” line appears below the conversation input box. It includes a short progress bar and a percentage showing how much of the space the assistant can remember this conversation has used.

MaiGPT: Always shown; no configuration required.

Web Chat: Shown only after an administrator enables **Show Context Usage** for that conversation platform (see [Enable it in Web Chat](#)). This switch is independent of “Enable Conversation Handoff.”

Display rules:

In a new conversation, the line appears after the assistant's first reply.

It updates after each assistant reply is complete.

The highest displayed value is 100%.

The closer usage gets to 100%, the more strongly we recommend handing off to a new conversation. Once it reaches 100%, the assistant may no longer be able to refer to the earliest parts of the conversation.

“Context Usage” below the input box updates after each assistant reply

After “Show Context Usage” is enabled in Web Chat, “Context Usage” and a percentage appear below the input box

Three ways to start a handoff

1. Ask the assistant directly

At any time, enter and send a message like this:

Hand off this conversation to a new conversation

The assistant creates a handoff summary (see [Handoff summary](#) below). You do not have to wait for usage to increase.

2. Use the prompt bar

When context usage reaches **80%**, a prompt appears above the input box:

This conversation is approaching its context limit. We recommend preparing a summary and continuing in a new conversation.

There are two buttons on the right side of the prompt:

Prepare Handoff: Automatically sends “Hand off this conversation to a new conversation” for you. The assistant then prepares a handoff summary.

Close: Dismisses the prompt so you can continue in the current conversation.

After you close it, the prompt appears again when usage crosses the next threshold (**90%** or **100%**). At 100%, the message changes to:

This conversation has reached its context limit. To preserve the full conversation context, we recommend preparing a summary and continuing in a new conversation.

Closing the prompt applies only to the currently open page. If usage is still above a threshold when you refresh the page, the prompt appears again.

3. Respond when the assistant asks

When context usage reaches 80%, the assistant adds a question to the end of its reply, for example:

This conversation is getting long. Would you like me to summarize the key points and continue in a new conversation?

If you reply “Yes” or otherwise agree, the assistant creates a handoff summary.

If you reply “No” or ignore the question, the assistant continues as usual and does not ask on every reply.

The assistant reminds you again when usage reaches 90% and 100%.

The assistant's question and the prompt bar appear at the same time. You can use either one to start the handoff.

Handoff summary

The assistant leaves the handoff summary in the original conversation as a “Handoff Summary” card with five sections:

Section	Content
Goal	What this conversation is meant to accomplish
Decided	Decisions and conclusions already confirmed
In Progress	Items still being worked on and their current status
To Do	What needs to happen next
Key References	Important numbers and names, including names of previously uploaded files

The summary uses the language of your conversation. Sections with no content are omitted.

At the bottom of the card, a “Continue in New Conversation” button indicates which new conversation will be created when you select it.

After a handoff request, the assistant leaves a handoff summary card in the original conversation

The system does not redirect you automatically After the summary is created, you remain in the original conversation. Review the summary before selecting “Continue in New Conversation.” If important information is missing, ask the assistant to add it in the original conversation or request another handoff.

You can hand off the same conversation more than once. Each handoff creates a new summary; only the **most recent** summary has a button.

Continue in a new conversation

Select “Continue in New Conversation”

Select **Continue in New Conversation** at the bottom of the handoff summary card. While the new conversation is being created, the button displays “Creating new conversation…”

Enter the new conversation

The view switches to the new conversation. Its title is the original conversation's title followed by “(Continued).” The system sends the first message for you: “Continuing from the handoff of .” The message is labeled “Sent by system.”

The assistant confirms the continuation

After reading the handoff summary, the assistant briefly confirms the status, for example, “Continued. The remaining tasks are…” You can then continue the conversation as usual.

The system sends the continuation message, and the assistant confirms the status after reading the summary

After the handoff, the conversation list shows how the two conversations are related: the original is labeled “Handed off to,” and the new one is labeled “Continued from original conversation.” The button in the original conversation changes to “Go to New Conversation.” Selecting it again returns to the same new conversation instead of creating another one.

The conversation list shows the handoff relationship between the two conversations

If creation of the new conversation fails, the page shows “Failed to create new conversation. Please try again,” and the button becomes available again.

What you can do after continuing

Continue working: The assistant knows the goals, decisions, and remaining tasks from the handoff summary. You can give it the next instruction right away.

Use the same assistant: The new conversation uses the same assistant as the original, with the same model, knowledge bases, and tool settings.

Review the original conversation: The full original conversation remains in the conversation list for you to reopen.

Hand off again: If the new conversation gets long, you can hand it off to another new conversation. Usage starts over in the new conversation.

The assistant in the new conversation can see only the handoff summary, not the other messages in the original conversation. The following content is not carried over:

Files and images uploaded in the original conversation (the summary lists file names only)

Files and Canvas content produced in the original conversation

Conversation details outside the summary

If you need any of this content in the new conversation, upload the files again or paste in the relevant passages.

If the original conversation or handoff summary has been deleted before you continue, the assistant tells you, “I couldn't find the handoff summary for the original conversation. Please tell me what you would like to continue.” In that case, explain what you need directly.

Web Chat visitor guidance

Visitors who are not logged in to Web Chat can hand off a conversation in the same way. Note that:

The new and original conversations are saved only in the visitor's current browser. They are not available in another browser or on another device.

After a visitor's conversation history expires, the original conversation can no longer be opened, but the new conversation can still be used.

Unsupported scenarios

Scenario	Description
Other conversation platforms, including LINE, Facebook Messenger, Microsoft Teams, and Slack	They do not show usage or prompts, and the assistant does not proactively ask about a handoff
Automatic redirect to a new conversation	Not supported. You must select “Continue in New Conversation” yourself
Handing off to a different assistant	Not supported. The new conversation always uses the original assistant
Carrying over attachments or generated files from the original conversation	Not supported. Upload them again in the new conversation
Compressing the conversation and continuing in the same conversation	Not supported. A handoff always opens a new conversation

Frequently asked questions

Can I hand off when usage is still low?

Yes. Enter “Hand off this conversation to a new conversation.” You do not need to wait for a prompt.

Can I still hand off after accidentally closing the prompt?

Yes. Ask the assistant to hand off directly in the input box.

How is context usage calculated?

The percentage estimates how much of the space the assistant can remember is currently used by this conversation, based on its content and the assistant's model. Models have different capacities, so the same conversation may show different usage with different models.

Can I keep talking in the original conversation after a handoff?

Yes. The original conversation is not locked, but its usage is already high, so we recommend continuing in the new conversation.

Related feature

[AI Chat](#)

AI Memory

The AI Memory page lets you view and manage the preferences and facts currently saved to your account. You can add, edit, delete, or reactivate your memories here.

This item appears on the account page only when your organization has enabled AI Memory.

When to use it

For example, a project manager wants to organize the communication preferences saved to her account. She can open **AI Memory** to review existing entries, then manually add a preference to “reply in Traditional Chinese.” If her needs change, she can edit or delete it at any time.

Open the memory list

Open the account menu in the upper-right corner and select **Profile**. In the organization section, select **AI Memory**. The page lists your memories. If there are none, it displays “No memories yet.”

Empty state of the AI Memory list

Add a memory manually

On the **AI Memory** page, select **Add** in the upper-right corner.

Choose a type and enter a topic, summary, and details. Use English `snake_case` for the topic, such as `communication_style`. You can put each detail on a separate line.

The screenshot shows a web interface for adding a memory. At the top, it says 'AI 記憶' and 'AI 助理從對話中學習到的偏好與事實。您可以查看、新增、編輯或刪除。'. There is a 'C' icon and a '+ 新增' button. Below this is a form with a dropdown menu for '類型' (Type) set to '事實' (Fact). The form has three main sections: '主題' (Topic) with a text input field containing a placeholder '主題 (英文 snake_case, 例如 communication_style)', '摘要' (Summary) with a text input field containing a placeholder '一行摘要', and '細節' (Details) with a text area containing a placeholder '具體細節 (每行一項)'. At the bottom right of the form are '取消' (Cancel) and '儲存' (Save) buttons. Below the form is a large light blue area with a faint illustration of a printer and the text '還沒有記憶' (No memories yet).

Fields required when adding a memory manually

Select **Save**. The new memory appears in the list.

Ask the assistant to remember in a conversation

Besides adding a memory manually on the **AI Memory** page, you can tell the assistant “Remember…” in a conversation. The assistant turns the information into a memory and saves it to your memory list for use in later conversations.

The assistant may also save facts it considers useful over the long term, such as your job role, preferred response language, or frequently used skills.

Requirements

The assistant can write a memory during a conversation only when all of these conditions are met:

The organization has enabled AI Memory.

Vector Memory is enabled in the AI assistant's settings.

The person in the conversation is an organization member. Conversations with anonymous visitors do not create memories.

The assistant does not save sensitive personal information such as credit card numbers, national ID numbers, passport numbers, bank account numbers, mobile phone numbers, email addresses, passwords, or API keys. If content contains such information, it is not saved as a memory, and the assistant explains that it cannot save it.

Example

For example, a marketing planner is preparing a presentation for a new product in MaiGPT and wants to avoid repeating its code name in every conversation. She types, “Remember: our demo product's code name is Aurora. Use that code name whenever you write product descriptions.” After using **Save Memory**, the assistant confirms that it has remembered. She can then see the memory on the **AI Memory** page, labeled **User Request**. When she starts another conversation and asks for a product description, the assistant uses the code name Aurora.

Ask the assistant to remember during a conversation; the steps show Save Memory

If a memory written by the assistant has the same topic as an existing memory, it updates that entry instead of creating a duplicate.

Memory source labels

Every memory in the list shows its source. Memories written by the assistant during a conversation display one of these labels:

Label	Meaning
User Request (green)	Content you explicitly asked the assistant to remember during a conversation
Assistant Initiated (purple)	Content the assistant decided to save during a conversation

The list may also show other source labels, such as Added Manually for memories you added on this page, or AI Extraction for information automatically extracted from conversations by the system. If you do not want to keep a memory, edit or delete it as described below.

Source labels in the memory list: AI Extraction and User Request

Manage existing memories

In the memory list, you can:

Edit the topic, summary, and details.

Delete memories that are no longer accurate or that you do not want the AI to use. Deleted memories cannot be restored.

Reactivate expired entries in the “Expired Memories” section.

Select Refresh to show the latest list.

Memories may affect answers in later conversations. Correct or delete information that is outdated, inaccurate, or should not be kept long term.

Canvas

Canvas is the area MaiGPT uses to display documents and charts. When AI generates content in Canvas, you can view the result alongside the conversation and use preview, source code, and download features depending on the content type. Markdown documents currently support previewing. To edit text manually, download the file first, then open it in a text editor.

Acme 中小企業內部知識庫文件治理報告

執行摘要

Acme 建置內部知識庫的目的，在於集中保存可驗證的作業知識，降低重複提問與人員異動造成的知識流失，並支援新人訓練、跨部門協作及流程品質。建議先從單一部門、低敏感且高頻的客服 FAQ、產品 SOP 或新人指南試辦，再逐步擴大。治理架構應由內容擁有人、主題審核者、平台管理者及資訊安全或隱私聯絡人分工，並以文件更新、存取權限與搜尋驗證三項機制維持可信度。

一、目的、範圍與治理架構

知識庫適合收錄 SOP、FAQ、產品與技術指南、範本、案例及新人教材；合約、財務憑證等正式紀錄則應連結或索引至正式紀錄系統。個資、薪資、健康資料、憑證與商業機密須隔離管理，密碼不得放入一般文件。Acme 可採「文件生命週期+角色權限+搜尋品質」架構：每份文件指定 owner、審核者、版本、敏感度、生效日、審查日、狀態與來源；平台管理者維護分類、流程和報表，內容正確性由主題專家負責。

二、文件更新實務

文件依「草稿、待審、已發布、定期審查、修訂或撤回、封存/處置」運作。發布前須檢查適用範圍、步驟、來源與安全影響；高風險文件應由不同於作者的專家審核，並分離編輯與批准權限。採主版號與次版號記錄重大及小幅變更，保留變更摘要、批准者、日期及相關工單。建議高風險內容每季、一般流程每半年、低風險文章每年審查；政策、系統或事故變更則立即重審。過期或撤回文件應移出一般搜尋，保

When to use Canvas

Scenario	Example prompt
Write a report	"Write a Q1 performance summary for me"
Write an email	"Help me reply to this customer's inquiry"
Organize meeting notes	"Format the following content as meeting notes"
Draw a flowchart	"Draw a leave request flowchart"
Create a table	"Create a table comparing Plan A and Plan B"

How to use it

Open Canvas

AI automatically opens Canvas when generating longer documents. You can also ask it directly:

"Use Canvas to write a..."

Edit content

After Canvas opens, you can:

View the document — Read the content in Markdown Canvas. Switch to source code mode to view the Markdown text; this mode is not a text-editing field.

Download and edit — Download the Markdown file, then edit it in a text editor. Changes to the local file are not automatically written back to Canvas.

Request changes — Clearly specify the paragraph you want to adjust in the conversation, such as "Make the second paragraph more concise."

Export

The upper-right corner of Markdown Canvas provides a **Download** menu:

Original format (.md) — Save the Markdown file so you can edit it in a text editor

PDF document — Download a PDF for reading and sharing

To copy the Markdown text, switch to code mode, then use the copy button in the content area.

What Canvas can create

Type	Suitable for	Example
Documents	Reports, emails, proposals, announcements	"Write a new product launch announcement"
Tables	Comparative analysis, data organization	"Compare quotes from three vendors"
Charts	Flowcharts, organization charts, sequence diagrams	"Draw the customer complaint handling process"

Tips

Let AI help you iterate You do not need to get everything right on the first try. Ask AI to create an initial version, then refine it step by step: 1. "Write an initial draft" 2. "Make the tone more formal" 3. "Add supporting data" 4. "Turn the last paragraph into a call to action"

Keep the versions you need Download the file first when you need to preserve the current content. Markdown Canvas preview and source code modes do not support direct text editing; edit the downloaded local file instead.

Write documents

You can ask AI to write reports, emails, proposals, announcements, or meeting notes, then view the result in Canvas. You can download Markdown documents and edit them manually.

Quick start

Tell AI directly what you want to write:

"Write a reply to a customer's request for a quote"

"Use Canvas to organize today's meeting notes"

"Write an internal announcement for a new feature launch"

After AI generates the document in Canvas, you can open the preview and download the result.

Edit and revise

Edit manually after downloading

Unlike Word, Markdown Canvas does not let you click text to edit it directly. Use the download menu in the upper-right corner to save the Markdown file, then open it in a text editor. Source code mode is only for viewing and copying.

Ask AI to make changes

Enter clear revision instructions in the conversation, such as:

You say	AI does
"Make the tone more formal"	Adjusts the tone throughout the document
"The second paragraph is too long. Make it more concise"	Shortens the specified paragraph
"Add a paragraph about the schedule"	Adds a paragraph
"Convert it to a bulleted list"	Reformats the content
"Translate it into English"	Translates the entire document

The download menu provides the original Markdown format and PDF

Common document templates

Try these prompts to quickly create common documents:

Document type	Example prompt
Weekly report	"Write this week's report. Highlights: completed Project A, started Requirement B, and will work on C next week"
Email	"Write an email politely but clearly declining a vendor's quote"
Meeting notes	"Format the following content as meeting notes: (paste notes)"
Proposal	"Write an outline for a proposal to introduce AI customer service, including a benefits analysis"
Announcement	"Write a system maintenance announcement for Saturday from 2:00 to 6:00 a.m."

Export documents

See [Export](#) above for how to download and copy Markdown documents. You can edit downloaded local files with the appropriate tools.

Create charts

Describe what you need in natural language, and AI can create flowcharts, organization charts, sequence diagrams, and other charts for you in Canvas. You do not need to learn any syntax—simply say what you want to draw.

Quick start

Tell AI directly what you want to draw:

"Draw a leave request flowchart"

"Draw our department's organization chart"

"Draw the process from a user placing an order to shipment"

Supported chart types

Chart type	Example prompt	Purpose
Flowchart	"Draw the reimbursement process"	Steps and decision branches

Chart type	Example prompt	Purpose
Organization chart	"Draw the department structure"	Reporting relationships
Sequence diagram	"Draw a sequence diagram for API calls"	Sequence of system interactions
Gantt chart	"Draw a Gantt chart for the project schedule"	Project scheduling
Mind map	"Organize the marketing strategy as a mind map"	Brainstorming and categorization

Edit charts

Want to make changes after the chart is generated? Just say what you need:

You say	AI does
"Add an approval step after the second step"	Adds a node
"Change the flowchart to run from left to right"	Adjusts the direction
"Remove the last step"	Deletes the node
"Change the colors to shades of blue"	Adjusts the style

Export charts

When finished, you can:

Copy — Paste into a presentation or document

Take a screenshot — Capture the chart directly in Canvas

Next steps

[Deep Research](#)

[Back to MaiGPT overview](#)

Deep Research

Deep Research is MaiGPT's automated research feature. Give it a topic, and AI will automatically search large volumes of web data, analyze and organize it, and produce a comprehensive research report.

It's ideal when you need to deeply understand a topic but don't want to spend hours searching and organizing information yourself.

How Is It Different from Regular Chat

	Regular Chat	Deep Research
Speed	Seconds	Minutes
Search Scope	Single search	Automatically searches 15-25 sources
Response Length	A few paragraphs	Full report (4,000+ words)
Source Citations	Sometimes	Always, with citations for every section
Best For	Quick Q&A	In-depth research, market analysis, technical investigation

When to Use It

Scenario	Example
Market research	"Research the current state and trends of the AI customer service market in Taiwan"
Competitive analysis	"Analyze the product differences between Company X and Company Y"
Technical investigation	"Research the latest developments and best practices in RAG technology"
Policies and regulations	"Compile the latest progress on AI-related regulations in Taiwan"
Industry reports	"Research global SaaS industry trends for 2025"

Starting a Research Session

In just three steps, AI will automatically produce a complete research report.

1. Click the Deep Research Button

Find and click the Deep Research button in the chat interface.

Enter a research topic, then click the blue "Deep Research" button to start

2. Enter Your Research Topic

Describe your research topic in one or two sentences. The more specific, the better the report quality.

General	Better
"Research AI"	"Research the current state, challenges, and success stories of generative AI adoption in Taiwanese enterprises"
"Analyze competitors"	"Compare MaiAgent, Dify, and Coze on their enterprise RAG capabilities"
"Look up regulations"	"Compile 2025 AI-related regulations and regulatory guidelines in Taiwan"

3. Wait for AI to Finish

AI will begin researching automatically. You can see:

- Planning phase** — AI breaks the topic into sub-questions
- Search phase** — Searches the web for each sub-question
- Analysis phase** — Organizes and cross-references data
- Report phase** — Produces the full report and saves it to Canvas automatically

The entire process typically takes 2-5 minutes, depending on topic complexity. You can work on other things — you'll be notified when it's done.

Give AI More Context Beyond the topic, you can also tell AI: - Your role: "I'm a marketing director" - Report purpose: "This is for a weekly meeting presentation" - Special focus: "Focus on the Taiwan market" - Format requirements: "Use bullet points, don't exceed 3,000 words"

Reading and Exporting Reports

After Deep Research completes, the report appears automatically in Canvas. You can read, edit, or export it directly.

Reading the Report

The report includes the following structure:

Section	Content
Summary	Key findings and conclusions
Body	Detailed analysis organized by topic in chapters
Source Citations	Each section cites its data sources, with clickable links to original text

After research completes, the report appears automatically in Canvas

Modifying the Report

After the report is generated, you can continue refining it in Canvas:

You Say	AI Does
"The summary is too long, condense it to 3 points"	Shortens the summary
"Add data charts"	Adds charts
"Translate this section to English"	Translates the specified section
"Reformat as a presentation outline"	Reformats the layout

Exporting

Click the export button in the top right corner of Canvas:

Copy — Paste into Email, Word, Notion, etc.

Download — Save as a file

Paste Directly into Presentations After copying, you can paste directly into PowerPoint or Google Slides with formatting preserved. This is perfect for quickly turning research results into weekly meeting reports.

Next Steps

[Continue editing with Canvas](#)

[Back to MaiGPT Overview](#)

AI Image Generation

MaiGPT has built-in AI image generation. Describe the visual you want in text, and AI will generate an image for you. Chinese descriptions are supported — no need to write in English. After generation, you can iteratively edit the image until you're satisfied.

Generate Images from Text Descriptions

Describe the image you want directly in the conversation:

"Draw an illustration of a modern office with bright tones"

"Generate a product branding image for marketing with a gradient blue background"

"Draw a cute mascot — a cat wearing a business suit"

Enter a text description and AI generates the corresponding image in real time

Description Tips

The more specific your description, the closer the image matches your expectations:

Generic Description	Better Description
"Draw a cat"	"An orange cat sitting on a windowsill, sunset in the background, watercolor style"
"Make a poster"	"An A4 portrait poster with the title '2025 Annual Conference,' tech style, blue-purple tones"
"Product image"	"A cup of coffee on a white background, overhead angle, a few coffee beans beside it, commercial photography style"

You can specify:

- **Style** — Watercolor, flat design, realistic, cartoon, commercial photography
- **Color tone** — Bright, warm, cool, monochrome
- **Composition** — Overhead, front-facing, close-up, panoramic
- **Purpose** — Social media post, presentation graphic, marketing material

Downloading Images

After an image is generated, click it to view in full size. Right-click or long-press to save it to your device.

Editing and Iterating on Images

Not satisfied with the AI-generated image? No need to start over — you can keep refining it in the same conversation until you're happy with the result.

How to Edit

After an image is generated, tell AI what you want to change directly in the conversation:

- "Change the background to white"
- "Change the person's expression to a smile"
- "Add the company logo in the bottom right corner"
- "Make the overall tone warmer"

AI will generate a new version based on your instructions.

Give modification instructions in the conversation and AI generates a new version of the image

Generating Based on an Existing Image

You can also upload an image and have AI use it as a reference to generate a new one:

(Upload a product photo)

"Using this image's style as a reference, generate similar marketing material for me"

"Convert this image to cartoon style"

Tips

Edit Step by Step Don't request too many changes at once. Modify one thing at a time for the best results: 1. First confirm the composition and subject are OK 2. Then adjust the color tone and style 3. Finally add details (text, logo, etc.)

Not Happy? Start Over If modifications keep drifting off course, just re-describe from scratch. AI generates independently each time, so starting fresh is sometimes faster than continuing to edit.

Next Steps

[Connectors](#)

[Back to MaiGPT Overview](#)

Connectors

Connectors let MaiGPT access your third-party tools such as Notion, Slack, Google Drive, and GitHub. Once connected, you can query and interact with data in these tools directly from the conversation.

Available Tools

Tool	What You Can Do After Connecting
Notion	Search pages, query databases, create new pages
Slack	Search messages, view channel content
Google Drive	Search and read documents
GitHub	View repositories, issues, pull requests

Available connectors are configured by your company administrator. If the tool you need is not listed, contact your admin.

How to Connect

1. Open Connector Settings

Click the tools icon in the chat interface to find the connectors section.

Click the "Connectors" button to see the list of available connectors

2. Authorize Your Account

Select the tool you want to connect, click "Connect," and you'll be redirected to that tool's authorization page. Follow the prompts to complete authorization.

3. Start Using

Once connected, ask questions directly in the conversation:

"Search Notion for pages about the Q1 plan"

"Look up the quote document in Google Drive"

Managing Connected Tools

You can do the following at any time in the connector settings:

View — Currently connected tools

Disconnect — Remove a tool's connection

Reauthorize — Reauthorize if a connection has expired

Notion

After connecting Notion, you can search Notion pages, query databases, and even create new pages directly in MaiGPT.

Connection Steps

- Open connector settings and find Notion
- Click "Connect" to go to the Notion authorization page
- Select the pages or workspace you want to grant MaiGPT access to
- Click "Allow" to complete authorization

What You Can Do

Once connected, say the following in the conversation:

You Say	MaiGPT Does
"Search Notion for pages about product specifications"	Searches and lists relevant pages
"Check the Notion project database for incomplete tasks"	Queries the database and filters results
"Create a new page in Notion titled Meeting Minutes"	Creates a new page
"Save this summary to Notion"	Writes content to Notion

Important Notes

Authorization Scope When authorizing Notion, you can choose which pages to share with MaiGPT. Only pages you've authorized can be searched. If a page can't be found, verify that you've authorized access to it.

Slack

After connecting Slack, you can search Slack messages and channel content in MaiGPT to quickly find previous discussions.

Connection Steps

- Open connector settings and find Slack
- Click "Connect" to go to the Slack authorization page
- Confirm the authorization scope and click "Allow"

What You Can Do

You Say	MaiGPT Does
"Search Slack for discussions about server migration"	Searches relevant messages
"Check what's been discussed recently in #general"	Summarizes channel content
"Find the link John mentioned last week"	Searches a specific person's messages

Google Drive

After connecting Google Drive, you can search and read your Google Drive documents in MaiGPT.

Connection Steps

- Open connector settings and find Google Drive
- Click "Connect" to go to the Google authorization page
- Select your Google account and allow access

What You Can Do

You Say	MaiGPT Does
"Search Google Drive for the quote document"	Searches and lists relevant files
"Open the last meeting minutes"	Finds and reads the document content
"Summarize that market analysis report in Drive"	Reads the document and produces a summary

Important Notes

Only Google Native Formats Are Supported Currently, only Google native formats such as Google Docs, Sheets, and Slides can be read. Office formats like .pptx, .docx, and .xlsx cannot be read directly. Please convert them to Google format in Google Drive before referencing them.

Shared Drive and External Sharing Limitations Files stored in a Shared Drive or existing as shortcuts may still fail to be read even after authorization. Ensure the authorized account has access permissions to the Shared Drive, and use the original file link instead of shortcuts.

GitHub

After connecting GitHub, you can query repositories, issues, pull requests, and other development-related information in MaiGPT.

Connection Steps

- Open connector settings and find GitHub
- Click "Connect" to go to the GitHub authorization page
- Select the repositories to authorize and confirm

What You Can Do

You Say	MaiGPT Does
"Check what open issues main-repo has recently"	Lists issues
"Show me a summary of changes in PR #123"	Reads the PR and summarizes
"Search the repo for code related to authentication"	Searches code

Next Steps

- [Manage access permissions](#)
- [Back to MaiGPT Overview](#)

Using on Different Devices

MaiGPT supports multiple access methods so you can chat with AI on any device. Conversation history syncs automatically, so you can continue discussions regardless of which device you log in from.

Supported Devices and Platforms

Platform	Description	Best For
Web	Use directly in your browser, no installation required	Office computers, laptops
iOS App	Native app for iPhone iPad	On the go, commuting, mobile work
LINE	Chat through the LINE official account	Users who prefer LINE
Microsoft Teams	Use directly within Teams	Teams already using Microsoft Teams

Which One Should You Choose?

Most complete experience → Web (supports all features)

Most convenient for anytime use → iOS App or LINE

Integrate with your workflow → Microsoft Teams

Conversation history is shared across all platforms. You can start a conversation on your computer and continue on your phone when you're out.

Next Steps

[Web](#)

[iOS App](#)

[Using on LINE](#)

[Using on Microsoft Teams](#)

[Back to MaiGPT Overview](#)

Web Version

The MaiGPT web version works in any browser with no software installation required.

How to Use

Open your browser and go to the MaiGPT URL provided by your company
Log in with your account and password (or use SSO)
Start chatting

Recommended Browsers

Browser	Support
Google Chrome	Recommended
Microsoft Edge	Supported
Safari	Supported
Firefox	Supported

Use the latest version of your browser for the best experience.

Next Steps

[iOS App](#)
[Using on LINE](#)
[Back to MaiGPT Overview](#)

iOS App

MaiGPT offers an iOS App so you can use it anytime on iPhone and iPad.

Installation

Open the App Store

Search for "MaiGPT" or scan the QR code provided by your company

Download and install

Login

After opening the app, log in with the same account and password as the web version. Conversation history syncs across devices.

Features

The app supports the same core features as the web version:

AI Chat

Upload photos (take a photo directly or select from your photo library)

Knowledge Base Q&A

Web Search

Some advanced features (Canvas, Deep Research) are recommended to be used on the web version for a better experience.

Next Steps

[Using on LINE](#)

[Using on Microsoft Teams](#)

[Back to MaiGPT Overview](#)

Using on LINE

If your company has connected MaiGPT to a LINE official account, you can chat with AI directly in LINE without opening a separate web page.

Getting Started

Scan the LINE QR code provided by your company, or search for the official account name

Add as a friend

Send a message to start chatting

What You Can Do on LINE

Feature	Supported
Text conversation	Yes
Send images for AI recognition	Yes
Knowledge Base Q&A	Yes
Upload files	Depends on configuration
Canvas	Not supported (use the web version)
Deep Research	Not supported (use the web version)

LINE is suited for quick Q&A and simple tasks. For advanced features like Canvas or Deep Research, switch to the web version.

Next Steps

[Using on Microsoft Teams](#)

[Web](#)

[Back to MaiGPT Overview](#)

Using on Microsoft Teams

If your company has integrated MaiGPT into Microsoft Teams, you can chat with AI directly within Teams.

Getting Started

Find the MaiGPT app in the left sidebar of Teams (or have your IT admin install it)

Click to open

Send a message to start chatting

What You Can Do on Teams

Feature	Supported
Text conversation	Yes
Send images	Yes
Knowledge Base Q&A	Yes
Upload files	Depends on configuration
Canvas	Not supported (use the web version)
Deep Research	Not supported (use the web version)

The Teams integration lets you use AI without leaving your work environment. It's ideal for quick Q&A and daily work assistance.

FAQ

The most common questions when using MaiGPT.

Question Categories

Category	What It Covers
Usage and Quotas	What operations consume usage, how to save usage
How to Choose Between Models	Which scenarios Claude, GPT, and Gemini are best for
Security and Privacy	How data is protected, whether conversations can be leaked

Quick Answers

How is MaiGPT different from ChatGPT?

MaiGPT is your company's dedicated AI assistant. Data stays within the company, it can query the company knowledge base, it supports multiple AI models, and it's managed centrally by your company's IT team.

Do I need to pay?

No. Usage is managed and paid for by your company.

Are my conversations secure?

All conversations are processed within the company environment and are not used for AI model training. See [Security and Privacy](#) for details.

Next Steps

[Usage and Quotas](#)

[How to Choose Between Models](#)

[Security and Privacy](#)

[Back to MaiGPT Overview](#)

Usage & Quotas

MaiGPT uses pay-as-you-go billing — you pay for what you use. Below is an overview of usage basics.

What Is Usage

Each time you chat with AI, the system calculates usage based on the length and complexity of the messages. Usage is typically managed and paid for by your company, so you don't need to pay anything yourself.

What Operations Consume Usage

Operation	Usage
Regular chat	Low
Uploading files for analysis	Medium (depends on file size)
Knowledge Base Q&A	Medium
Deep Research	High (performs multiple searches and analyses)
AI Image Generation	Medium
Deep Thinking	Higher (more than regular chat)

How to Check Usage

How to check usage varies by company configuration. If your interface shows usage information, you can view it directly. Otherwise, contact your admin to learn about your usage status.

Tips for Saving Usage

More precise questions use less usage — Specific questions produce shorter responses and consume less usage

Make good use of the same conversation — Continuing a conversation is more efficient than starting a new one, since you don't need to repeat background information

Choose the right feature — Simple questions don't need Deep Research or Deep Thinking

Next Steps

[How to Choose Between Models](#)

[Security and Privacy](#)

[Back to MaiGPT Overview](#)

How to Choose Between Models

MaiGPT offers multiple AI models. Here's a quick guide to help you understand the differences.

Quick Comparison

Model	Strengths	Speed	Best For
Claude	Chinese comprehension, long-form writing, analytical reasoning	Medium	Writing reports, analyzing documents, complex reasoning
GPT	Well-rounded general ability, code	Medium	Code, translation, general Q&A
Gemini	Fast response speed, multimodal	Fast	Quick Q&A, image understanding
DeepSeek	Strong reasoning ability	Medium	Math, logical reasoning
Gemma	Google open-source, lightweight and efficient	Fast	Lightweight deployment, edge computing
Grok	Real-time information, humorous style	Medium	Current events Q&A, creative writing
Llama	Open source, privately deployable	Varies	On-premises deployment needs

Not Sure How to Choose?

Use this decision flow:

General work (writing documents, research, translation) → Use the default model

Not satisfied with quality → Try switching to Claude or GPT

Need maximum speed → Use Gemini

Complex reasoning or calculations → Use Claude or DeepSeek

There is no "best" model Every model has strengths and weaknesses. The most practical approach is to try the same question with different models and find the one you prefer.

Next Steps

[Select an AI Model \(How-To\)](#)

[Security and Privacy](#)

[Back to MaiGPT Overview](#)

Security & Privacy

MaiGPT is designed from the ground up to protect enterprise data security. Below are answers to your most frequently asked security questions.

FAQ

Can my conversation content be seen by external parties?

No. Your conversation data is restricted to your company's environment and cannot be accessed by other companies or external parties.

Will AI use my conversations to train models?

No. The AI models used by MaiGPT do not use your conversation data for training.

Can company administrators see my conversations?

This depends on your company's permission settings. Consult your IT admin for the specific privacy policy.

Are uploaded files secure?

Uploaded files are stored in your company's secure environment, and all transfers are encrypted end-to-end.

Are connectors (Notion, Slack, etc.) secure?

Connectors use standard OAuth authorization. MaiGPT does not store your account passwords. You can revoke authorization at any time.

Usage Recommendations

Avoid entering highly confidential information Although MaiGPT has comprehensive security protections, avoid entering passwords, credit card numbers, national ID numbers, or other highly sensitive information directly in conversations.

[Back to MaiGPT Overview](#)

Agent Marketplace

What Are Official Built-in Agents?

Official built-in Agents are AI assistants that MaiAgent has designed, tested, and listed in the Agent Marketplace. Their role instructions, models, and tools are already configured. Once an organization administrator enables one, members can start chatting immediately. There is no need to build an Agent, adjust its role instructions, or prepare a knowledge base first.

In the **Agent Marketplace**, official built-in Agents and Agents your organization creates appear on separate tabs: **Official Built-in** and **Created by Organization**.

How They Differ from Organization-created Agents

	Official built-in Agent	Organization-created Agent
Creator	Designed, tested, and maintained by MaiAgent	Created with Agent Builder
Setup before use	Ready to use	Must be built manually from scratch
Role instructions tools model	Cannot be changed	Fully customizable
Knowledge base	You can import your own documents	Fully customizable
Version updates	Automatically follows the latest official version	Maintained by your organization
Quantity limit	Plan-specific limit on simultaneously enabled Agents	Depends on the plan (see Trial and Subscription Plans)
Who can use it	An administrator chooses the available users	Determined by role permissions

In short: **Use an official built-in Agent to get started quickly; build your own for customization.** You can use both. Many organizations use official built-in Agents for common tasks and create their own Agents for company-specific processes.

What You Can and Cannot Change After Enabling One

When you enable an official built-in Agent, the system creates a **locked assistant** in your organization from the official blueprint.

You can:

Import your own documents into this Agent's dedicated knowledge base.

Choose which roles and groups can use it.

Complete any connector authorization it needs.

You cannot:

Change its role instructions (System Prompt).

Add or remove tools or skills.

Switch its language model.

It is normal if there is no edit button for an official built-in Agent in the [AI Assistants](#) list. MaiAgent maintains its settings centrally to provide consistent quality across organizations and automatically apply official updates. If you need custom role instructions or a different set of tools, build an assistant with [Agent Builder](#), or apply an official template from the [Agent Template Library](#) to create an assistant you can edit freely.

Versions Update Automatically

Each official built-in Agent card displays a [version](#). When MaiAgent releases a new version to improve prompts, correct behavior, or extend capabilities, **organizations that have enabled the Agent automatically receive the latest version**. You do not need to, and cannot, upgrade manually or pin a version.

If an Agent's response style or output format changes, MaiAgent has usually released a new version. Documents you imported into its knowledge base are unaffected.

The Number You Can Enable Depends on Your Plan

Official built-in Agents have a **limit on the number enabled at the same time** and a **cooldown period** after activation. Allowances differ by plan. See [Trial and Subscription Plans • Feature Differences](#).

If your organization's plan does not include official built-in Agents, the [Official Built-in](#) tab will not appear in the [Agent Marketplace](#). Contact the sales team to upgrade your plan.

For details on enabling Agents, calculating the cooldown period, and what happens when you reach the limit, see [Enable and Manage](#).

Available Scenarios

Official built-in Agents fall into two groups, **job functions** and **industries**, with 14 scenario categories in total:

Job Functions

Scenario category	Example Agents
Human resources	Interview question generation, resume evaluation, job description writing
Legal	Contract risk review, nondisclosure agreement review, regulatory compliance checks
General affairs	Administrative announcement writing, purchase price comparisons, document classification and filing
Accounting	Expense receipt organization, financial report summaries and analysis, business tax Form 401 analysis
Project management	PRD writing, requirements organization and analysis, competitor analysis
Personal productivity	Meeting summaries, presentation design, email reply writing

Industries

Scenario category	Example Agents
Healthcare	ICD-10 classification code suggestions, discharge record summaries, nursing shift handoff reports
Manufacturing	Quality issue 8D reports, SPC process control analysis, equipment knowledge Q&A
Banking	Credit assessment reports, KYC due diligence summaries, financial regulation interpretation lookup
Securities	Individual stock research, internal compliance policy Q&A, premeeting preparation for financial advisors
Retail	Daily sales summaries, product listing copy, customer complaint and review analysis

Scenario category	Example Agents
General administration	Citizen petition classification and assignment, press release drafting, preliminary grant application review
Government accounting	Budget execution and final accounts analysis
Legal affairs and procurement	Summaries of regulatory interpretations, tender and procurement document checks

The table lists only representative examples for each category. MaiAgent continues to add official built-in Agents. For the current list, check the [Official Built-in](#) tab in the [Agent Marketplace](#).

Next Steps

Want to get started → [Use an Official Built-in Agent](#)

Are you an organization administrator enabling Agents for your team → [Enable and Manage](#)

Use Official Built-in Agents

This page is for **all members**. It explains how to find the right official built-in Agent in the **Agent Marketplace**, how to work with it, and who to contact if you run into an issue.

If you are an organization administrator deciding which Agents to make available to your team, see [Enable and Manage](#).

How Official Built-in Agents Work

Every official built-in Agent follows the same workflow: **you provide source material and requirements, it asks follow-up questions until the details are clear, and then it produces the result.**

The four-step workflow for official built-in Agents

1. Follow the Greeting to Enter Your Task or Upload Files

When you start a conversation, the Agent first sends a **greeting** explaining what it can help with and what you need to provide. Follow its instructions: type a description of your request or upload files, such as contracts, résumés, reports, or meeting recordings, depending on the Agent.

2. The Agent Offers Options and Recommendations to Clarify the Output

The Agent does not immediately start working as soon as it receives your material. It asks about key decisions—for example, “How many years of experience should these interview questions target?” or

“Should the report use bullets or prose?” —and **provides options directly**, so you can click one or add a short response.

At this stage, some Agents also **retrieve external information through connectors**, such as data from your calendar, cloud drive, or a third-party system. The first time a connector is used, you will be asked to authorize access.

Do not skip this step. The extra 30 seconds you spend answering clarification questions directly improves the accuracy of the output.

3. Generate a Draft

Once the details are confirmed, the Agent generates the result. You can continue asking for changes in the conversation—adjust the tone, add sections, or change the structure—without starting over.

4. Choose Whether to Export to a Specific File Format

When you are satisfied with the draft, ask the Agent to export it as a file. Supported formats vary by Agent and commonly include Word, Excel, PDF, and presentation files. The generated file appears in the conversation for you to download.

Choose an Agent from the Agent Marketplace

Open the Agent Marketplace

After signing in, select **Agent Marketplace** from the left sidebar.

Switch to the “Official Built-in” Tab

At the top of the marketplace, switch from the **Organization-built** tab to **Official Built-in**.

Search or Filter by Scenario Category

Search: Use the search bar at the top to search by Agent name, description, or scenario keyword

Scenario categories: Narrow the list using category tags such as Human Resources, Legal, Healthcare, or Manufacturing, or select **All Scenarios** to see everything

Agent Marketplace → Official Built-in: tabs and scenario categories appear at the top, with the enabled count in the upper-right corner

Cards are divided into two sections:

Section	Meaning	Available on the Card
Enabled	Your organization has enabled the Agent, so you can use it immediately	Preview and Start Conversation
Not Enabled	Your organization has not enabled the Agent	Preview only; no Start Conversation option

The upper-right corner of the page shows the number of Agents currently Enabled by your organization and its limit. This allowance is managed by the organization administrator.

Preview Before You Decide

Not sure what an Agent actually does? Select Preview (the eye icon) in the upper-right corner of its card. You can preview it without enabling it.

The window is titled Conversation × Guide Sync and plays two synchronized columns:

Left column: Replays one Example Scenario, from the greeting and the user's request through each step completed by the Agent

Right column—Guide • What This Step Does: As the conversation advances, the corresponding STEP 01, STEP 02, and so on is highlighted, explaining what happens and which capabilities are used

After playback finishes, the right column changes to **Guide • Select Each Step for Details**. Select any step to expand it, or choose **Replay** to watch again.

Two more details appear at the bottom of the window:

Connectors: The third-party services used by this Agent, such as Microsoft 365 or Google Workspace

Enablement status: Agents that are not enabled display **Must Be Enabled by an Organization Administrator**; enabled Agents offer **Start Conversation**

Preview window: the left column replays an example conversation while the right column highlights the corresponding guide step

Start a Conversation

Select **Start Conversation** on a card in the **Enabled** section to open a new conversation, then follow the four steps under How Official Built-in Agents Work.

Step 1: The greeting tells you exactly what to provide; use the paper clip in the lower-left corner to upload files

Step 2: The Agent asks follow-up questions using option cards; the upper-right corner shows how many questions remain

Step 3: After confirming the details, the Agent generates a structured draft

Return to Recently Used Agents

After you have **had a conversation with at least one official built-in Agent**, a **Recently Used** row appears at the top of the marketplace, ordered from most to least recent conversation. Select **Continue Conversation** to resume your previous work without browsing through the categories again.

This row includes only Agents that are enabled and that you have personally used. It is normal for the row not to appear when you have just joined an organization and have not started using any Agents.

When an Official Built-in Agent Is Unavailable

These three situations look similar but have different causes:

What You See	What It Means	What to Do
The Agent is in the Not Enabled section and has Preview but no Start Conversation option	Your organization has not enabled this Agent	Ask your organization administrator to enable it
The Agent is in the Enabled section but displays No Permission to Use	Your organization enabled it, but you are not in this Agent's Authorized Users list	Ask your organization administrator to add your role/group to the authorized users

What You See	What It Means	What to Do
The Official Built-in tab does not appear in the marketplace	Your plan does not include official built-in Agents	Contact the sales team to upgrade your plan. See Trial and Subscription Plans

If a search returns no results, select **Clear Search** to view every Agent in the category, or select **Clear Selected** to remove the category filter.

If a category has no enabled Agents, it displays **No Enabled Agents in This Category** and a **Request Enablement** button. This button takes you to [Built-in Agent Management](#), but an organization administrator with the required permission must still enable the Agent.

Enable and Manage

This page is for organization administrators. For instructions for general members, see [Use Official Built-in Agents](#).

Open Built-in Agent Management

Go to [Organization Settings](#) → [Built-in Agent Management](#).

You can also select [Go to Built-in Agent Management](#) in the [Agent Marketplace](#) to open it directly.

If [Built-in Agent Management](#) is not in the menu, your plan does not include official built-in Agents. The screen will display [Built-in Agents cannot be enabled under the current plan. Please upgrade your plan](#). Contact the sales team to upgrade. If you can view the page but the switches are locked, you do not have permission to manage enablement. Contact your organization administrator.

Built-in Agent Management: enablement count and filters appear at the top; action icons and an enablement switch appear on the right of each row

Each row shows the Agent's name, scenario category, version, and current [Authorized: {Role Name}](#) setting. Deactivated Agents display [Deactivated, Knowledge Base Retained](#), while Agents in cooldown display [Cooldown: N Days Remaining](#).

Three action icons, followed by the enablement switch, appear from left to right on each row:

Icon	Purpose
Configure Authorized Users	Specify which roles/groups can use the Agent
Clear Knowledge Base	Delete all imported documents (cannot be undone)
Import to Knowledge Base	Open the Agent's dedicated knowledge base to upload documents

Use the search box at the top to search by keyword. You can also filter by status—**All Enabled**, **Not Enabled**, **Knowledge Base Retained**—or by scenario category.

Select the row itself, rather than an icon, to open the Agent's **Preview** window. You can see how it works before deciding whether to enable it.

Enable or Deactivate: Select “Apply Changes” to Take Effect

Changing a switch does not take effect immediately. All changes remain pending until you select **Apply Changes** at the bottom to submit them together.

Switch the Agents You Want to Enable or Deactivate

In the list, set the switch to **Enabled** or **Deactivated**. The row is then labeled **Pending Enablement** or **Pending Deactivation**.

Review the Change Summary at the Bottom

A fixed action bar appears at the bottom of the screen. When changes are pending, it shows the number **Pending Enablement**, the number **Pending Deactivation**, and the resulting number of **Enabled** Agents versus the limit. It also reminds you that **an Agent cannot be deactivated within 7 days of enablement**. The **Apply Changes** button becomes available at this point.

Select “Apply Changes”

Select **Apply Changes** to submit everything at once. To discard the changes, select **Cancel** to restore all switches.

After a switch is turned off, the row is labeled “Pending Deactivation,” and the counts and cooldown reminder update in the action bar below

If an individual item fails after the changes are applied, the screen identifies the reason for each failure, such as reaching the limit, an active cooldown period, or insufficient permissions. Successful changes are unaffected.

Enablement Limit and Cooldown Period

Concurrent Enablement Limit

The **Enabled Count** at the top of the page shows how many slots are currently used and the maximum allowed. The limit depends on your plan. See [Trial and Subscription Plans • Feature Differences](#).

When the limit is reached, switches for Agents that are not enabled are locked and display **Enablement limit reached. Deactivate an Agent or upgrade your plan.**

7-day Cooldown Period

Each time an Agent is enabled, it cannot be deactivated for 7 days. During this period, the list displays **Cooldown: N Days Remaining**, and the switch is locked with the message **In cooldown. Can be deactivated in N days.**

The cooldown period restarts each time the Agent is enabled. If you deactivate and then re-enable it, you must wait another 7 days before deactivating it again. We recommend using [Preview](#) to confirm that an Agent is suitable before enabling it, because you cannot swap it out during the cooldown period.

When You Want to Downgrade Your Plan

If the number of Agents currently enabled exceeds the new plan's limit, the system blocks the plan change. You must first deactivate enough Agents to meet the new plan's limit. Because deactivation is also subject to the 7-day cooldown period, allow time for the cooldown when planning a downgrade.

What Happens When You Deactivate an Agent

Deactivation does more than hide the Agent. The system removes the assistant along with its conversation channels: The assistant disappears from the [AI Assistants](#) list, and members can no longer chat with it. Its conversation channels, such as Web Chat, and group permissions are removed. Its Agent schedules stop running. Your imported knowledge base is retained, with the status [Deactivated, Knowledge Base Retained](#).

If you re-enable it later, the system creates **a new assistant** based on the latest official blueprint and **automatically reconnects the original knowledge base**, so you do not need to upload the documents again. However, conversations from before deactivation do not appear under the new assistant.

Configure Authorized Users

Enabling an Agent does not make it available to the entire organization. You must also specify which roles/groups can use it.

Select [Configure Authorized Users](#) on the Agent's row. In the drawer, select the roles/groups that can use it, then select [Save](#).

Configured Agents display [Authorized: {Role Name}](#) in the list.

Agents without authorized users display [Not Yet Available](#).

Select the roles/groups allowed to use this Agent in the drawer

If a member sees **No Permission to Use** on an enabled Agent in the **Agent Marketplace**, they have not been added to its authorized users. Return here and add them.

Import to the Dedicated Knowledge Base

You cannot change the role instructions or tools of an official built-in Agent, but **you can give it your organization's documents**. Every enabled Agent has a dedicated knowledge base.

Select **Import to Knowledge Base** on the Agent's row to open its knowledge base settings. From there, use it like any other knowledge base: upload documents, create FAQs, and configure tags. See [Knowledge Base Overview](#).

For example, you could import your company's contract templates and review guidelines into a “Contract Risk Review” Agent, or internal administrative policies into an “Administrative Process Q&A” Agent, so its answers reflect your organization's actual rules.

Clear the Knowledge Base

Select **Clear Knowledge Base** on the Agent's row to delete its imported documents.

This permanently deletes all imported documents and cannot be undone. Before proceeding, make sure the documents are backed up elsewhere.

The outcome depends on the Agent's current status:

Agent Status	After Clearing
Enabled	Only the knowledge base content is deleted. The knowledge base itself remains connected to the Agent, and you can continue importing new documents
Deactivated, Knowledge Base Retained	The entire knowledge base is deleted and disconnected. Re-enabling the Agent later creates a new, empty knowledge base

Connectors: Which Ones You Need to Configure First

Some official built-in Agents must connect to third-party services, such as Google Workspace, Microsoft 365, or Notion, to retrieve data. Cards indicate one of two authorization types:

Label	Meaning	Who Takes Action
Administrator Must Configure Connection First	The connector uses organization-level credentials	An organization administrator completes the connection setup before members can use it
No label	Personal user authorization	Each member authorizes their own account in the conversation the first time the connector is used

Administrator Must Configure Connection First does not mean that you must authorize every user. It is a one-time, organization-level setup. For connectors without this label, each member authorizes their own account, and the administrator does not need to be involved.

For more information, see [Connectors](#).

Create an AI Assistant from the Agent Template Library

The **Agent Template Library** turns Agents designed by MaiAgent into templates. Preview a template's sample conversation, then click **Apply** if it fits your needs. The system creates an **editable** AI assistant in your organization. You can then adjust its role instructions, knowledge base, and tools to suit your company.

Template Library vs. Agent Marketplace

Both offer official Agents from the same source. The difference is whether you can edit the Agent after adding it:

	Agent Marketplace (enable an official built-in Agent)	Agent Template Library (apply a template)
What you get	A locked official assistant	An editable organization-owned assistant
Role instructions tools model	Cannot be changed	Can be changed freely
Version updates	Automatically follows the latest official version	Keeps the version you applied; later official updates do not overwrite it
Counts toward	Limit on concurrently enabled official built-in Agents	Plan limit on the number of AI assistants

In short: **Use the Agent Marketplace if you want an official Agent that works out of the box and is maintained for you. Use the Agent Template Library if you want to customize an official design.** For the Agent Marketplace, see [Use Official Built-in Agents](#).

To see **Agent Template Library** in the left menu, your organization's plan must include Agent Builder, and your role must have AI assistant permission under **AI Features**. For role settings, see [Role Permissions](#).

Example Use Case

Lin, a sales manager at a trading company, wants the team to answer customer emails in a consistent tone with clear key points, but does not want to write role instructions from scratch. In the **Agent**

Template Library, Lin searches for “email” and finds the “Email Reply Writer” template. Lin previews the sample conversation and confirms that it summarizes the incoming email and checks the tone and version before drafting a reply. Lin then clicks **Apply**. The system creates an AI assistant with the same name and a dedicated knowledge base. Next, Lin clicks **Go to AI Assistant Settings**, renames the assistant to the team's preferred name, and saves it. Lin can then upload the company's quotation guidelines to the assistant's knowledge base and adjust its role instructions so replies better match company practice.

Steps

1. Open the Agent Template Library

Click **Agent Template Library** in the left menu. The page displays all available official templates as cards. Each card shows the template name, category, and description. If a template uses MaiGPT connectors, such as Microsoft or Google, the corresponding connector icons appear on the card.

Agent Template Library in the left menu and the list of template cards

2. Filter or search for templates

Switch between **All**, **Role**, and **Industry** at the top, then select a category tag below, such as **Legal** or **Banking**, to narrow the results. Use **Search template names or descriptions** in the upper-right corner to find a template by keyword.

Searching for “email” finds the Email Reply Writer template

3. Preview a template

Click a card or its **Preview** button to open the preview window:

A sample conversation plays on the left so you can see how the Agent interacts with users. Click **Replay** to watch it again from the beginning.

The guide on the right follows the conversation and explains each step.

An **Apply** button appears at the bottom. If your organization has enabled the Ask AI assistant in the admin console, **Ask AI** also appears. You can ask AI to suggest how to customize the template.

Preview window: sample conversation and step-by-step guide, with Ask AI and Apply buttons at the bottom

The preview only plays a sample conversation prepared by the provider. It does not create resources or use your quota.

4. Apply the template

Click **Apply** in the preview window. After creation, an **Agent Added** window lists the resources created:

AI assistant: It has the same name as the template. If your organization already has an assistant with that name, the system automatically adds a number to the name.

Knowledge base: A dedicated knowledge base with the same name, already linked to the assistant.

You can go straight to the next step from this window:

Go to Conversation: Try chatting with the new assistant immediately.

Go to Upload Knowledge Base Documents: Add your company's documents to its dedicated knowledge base.

Go to AI Assistant Settings: Adjust the name, role instructions, tools, and other settings.

Maybe Later: Close the window and find the assistant later in the **AI Assistants** list.

After applying the template, the new AI assistant and knowledge base are listed

Each time you apply a template, a new AI assistant is created and counted toward your plan's AI assistant limit. If the limit has been reached, you will see “The creation limit has been reached. Upgrade your plan or contact an administrator.” For plan limits, see [Trial and Subscription Plans](#).

5. Customize the assistant

Click [Go to AI Assistant Settings](#) to open the new assistant's settings page. Like an assistant you create yourself, you can change its [Name](#) and LLM model. You can also use the left menu to adjust [Knowledge Base Settings](#), [Tools](#), [MaiGPT Connectors](#), and [Skill Settings](#). The tools, skills, and connectors included in the template are already attached. Click [Save](#) after making changes.

Assistant settings after applying the template: knowledge base, tools, connectors, and skills are preconfigured, and the name can be changed

For details on each setting, see [Create an AI Assistant](#) and [Add Role Instructions to an AI Assistant](#).

Agent Builder Overview

What is Agent Builder?

Agent Builder is the core building area of the MaiAgent platform. Here, you can combine different modules to create AI Agents that can answer questions, query data, and execute tasks.

Big Picture: How Agent Relates to Each Module

MaiAgent Agent Builder Feature Overview

Agent Builder Module Overview

The Agent is the core brain, responsible for understanding user questions and generating responses. Other modules extend the Agent's capabilities — the Knowledge Base gives it domain expertise to reference, the Database lets it query structured data, Tools let it perform actions, Skills let it follow SOPs to handle complex tasks, and Scheduled Tasks let it run automatically on a schedule. The Crawler is one of the data sources for the Knowledge Base. When tasks become complex, Agent Teams allow multiple specialized Agents to collaborate and divide work; Hooks automatically enforce safety and quality at the entry and exit points of AI messages.

Twelve Modules at a Glance

Module	What It Does	Typical Use Cases
<u>Agent (AI Assistant)</u>	The core of conversations — understands intent and generates responses	Customer service bots, internal Q&A, business assistants
<u>Knowledge Base</u>	Provides enterprise-specific knowledge for Agent to reference	Product manuals, internal policies, FAQ
<u>Database</u>	Lets Agent query structured data using natural language via Text2SQL	Order lookup, inventory queries, report analysis
<u>Scheduled Tasks</u>	Lets Agent automatically execute tasks on a schedule	Daily summary reports, periodic data checks
<u>Tools</u>	Lets Agent call external services to perform actions	Send emails, check weather, integrate with CRM
<u>Code Interpreter</u>	Executes Python in a sandbox for file processing and computation	Generate Word/presentations, data analysis, chart creation

Module	What It Does	Typical Use Cases
<u>Browser Tool</u>	Controls a browser to navigate web pages, interact with elements, and capture screenshots	Operate websites without APIs, scrape data after login, automate web workflows
<u>Voice Agent</u>	Lets Agent serve customers through listening and speaking (Realtime STT + LLM + TTS)	Phone customer service, IVR, voice queries, hands-busy scenarios
<u>Skills</u>	Defines multi-step reasoning and decision flows for Agent	Quoting processes, troubleshooting SOPs
<u>Crawler</u>	Automatically scrapes content from web pages and imports it into the Knowledge Base	Crawl official websites, scrape public information
<u>Agent Teams</u>	Organizes multiple specialized Agents into collaborative teams with handoff and delegation	Customer service routing, order/returns/recommendations multi-agent collaboration
<u>Hook (Message Interception)</u>	Automatically intervenes before messages enter AI and before responses are sent	PII masking, malicious prompt interception, response quality control

Not Sure What to Use?

Go to [I Want to Do X — What Should I Use?](#) to see common scenario comparisons.

Recommended Build Order

If this is your first time using MaiAgent, follow this order:

```

Step 1 → Create an Agent, set up role instructions (what role it plays, how it responds)
Step 2 → Build a Knowledge Base, upload documents or FAQ (give it something to reference)
Step 3 → Expand as needed: add Tools, Database, Skills (based on what capabilities your scenario requires)
Step 4 → Connect a conversation platform to go live (Web Chat, LINE, Messenger ... )

```

You don't need to configure all modules at once. Start with Agent + Knowledge Base, then gradually expand capabilities.

Agent (AI Assistant)

Agent Core Concepts

Agent Core Workflow: LLM-Driven × System Prompt × Memory

What Is This?

An Agent is an AI conversational persona you build on MaiAgent. Each Agent is an independent chatbot with its own identity, personality, knowledge, and capabilities.

Think of an Agent as a new employee — you need to tell it:

- **Who you are** (System Prompt)
- **What you know** (Knowledge Base, Database)
- **What you can do** (Tools, Skills)

Once configured, the Agent can serve users across various conversation platforms.

Core Concepts

Large Language Model (LLM)

The Agent's comprehension and response capabilities come from the underlying Large Language Model (LLM). Think of the LLM as the Agent's "brainpower" — different models vary in comprehension, response quality, speed, and cost.

When creating an Agent, you can choose the model that best fits your scenario. MaiAgent supports multiple models, including Claude, GPT, and more — you don't need to manage the models yourself; the platform handles it for you.

Quick guide: For precise responses and complex reasoning, choose a more powerful model. For high-frequency simple Q&A or cost control, choose a faster and lighter model.

System Prompt

The system prompt defines how the Agent behaves. For example:

"You are a friendly customer service representative. Respond in Traditional Chinese with a professional yet approachable tone."

"You are a financial analysis assistant. Only answer finance-related questions. If data is uncertain, clearly state so."

A well-crafted system prompt significantly improves the Agent's response quality.

Response Mode

MaiAgent offers two response modes:

Chat Mode: Suitable for general Q&A, responds directly using Knowledge Base content

Agent Mode: Suitable for scenarios requiring multi-step reasoning, where the Agent decides what data to look up and which tools to use

Memory

Agents have memory capabilities:

Conversation Memory: Remembers what was discussed earlier within the same conversation

Long-Term Memory: Retains important information across conversations, so you don't need to reintroduce yourself every time

Advanced note: The memory feature allows the Agent to maintain contextual coherence across multiple conversation turns and recall past conversations through vector retrieval. You can adjust related parameters in the Agent's "Memory Settings."

What Do I Need to Do?

Create an Agent — Give it a name and choose a language model

Write a System Prompt — Define the Agent's role and response style

Attach Capabilities — Connect a Knowledge Base, Tools, Skills (as needed)

Test Conversations — Test the results in the built-in chat window

Connect a Platform and Go Live — Deploy to Web Chat, LINE, or other conversation platforms

[System Prompt Design Guide](#)

[Add a System Prompt to Your AI Assistant](#)

Knowledge Base

Knowledge Base Concept

Knowledge Base RAG Flow: From Document Upload to Agent Retrieval and Response

What Is This?

A Knowledge Base is the enterprise knowledge encyclopedia for your Agent. You add company documents, FAQs, and web content to the Knowledge Base, and the Agent can answer user questions based on this data.

Without a Knowledge Base, the Agent can only respond using the language model's general knowledge. With a Knowledge Base, it can answer enterprise-specific questions like "What is our company's return policy?"

What Can Go in a Knowledge Base?

Data Type	Description	Suitable Scenarios
Document Upload	PDF, Word, Excel, TXT, etc.	Product manuals, internal guidelines, contract templates
FAQ	Question-answer pairs	Frequently asked questions, standard responses
Crawler Import	Automatically scrape content from web pages	Official website information, public data

How Is It Different from a Database?

This is the most frequently asked question:

	Knowledge Base	Database
Data Type	Unstructured (documents, articles, FAQs)	Structured (tables, fields, numbers)
Query Method	Semantic search ("What is the return policy?")	SQL queries ("What was last month's revenue?")

	Knowledge Base	Database
Best For	Knowledge-based questions, policy guidelines, operating instructions	Data queries, statistical analysis, real-time status

Simple rule of thumb: If the answer is in a "document," use a Knowledge Base; if the answer is in a "report," use a Database.

Advanced Note: The Knowledge Base uses RAG (Retrieval-Augmented Generation) technology under the hood. Uploaded documents are split into paragraphs and converted into vectors. When a user asks a question, the system finds the most relevant paragraphs and provides them to the Agent as the basis for its response.

What Do I Need to Do?

Create a Knowledge Base — Name it and select an Embedding model

Import Data — Upload documents, create FAQs, or use a crawler to scrape content

Search Test — Test the Knowledge Base with sample questions to verify it finds the correct answers

Attach to an Agent — Link this Knowledge Base in the Agent settings

Further Reading

[Knowledge Base Overview](#)

[How to Create a Knowledge Base: Basic Settings](#)

[How to Create FAQs](#)

[Document Management: Tags and Metadata](#)

[Search Test](#)

Database

Database concept

Text to SQL: Natural Language → SQL Query → Plain Language Response

What Is This?

Database enables Agents to query structured data using natural language. When a user asks "How many laptops did we sell last month?", the Agent automatically converts the question into a SQL query, retrieves the answer from the database, and responds in plain language.

The technical name for this feature is **Text to SQL**.

When Do You Need It?

When your use case involves:

Data queries: Order status, inventory quantities, sales figures

Statistical analysis: "How much did this quarter's revenue grow compared to last quarter?"

Real-time status: "How many pending tickets are there right now?"

The answers to these questions are stored in structured tables, not in documents, so you need a Database rather than a Knowledge Base.

What Databases Are Supported?

Type	Description
MaiAgent Built-in Database	A database provided by the platform where you can directly upload CSV files or manually create tables
External Database	Connect to your PostgreSQL, MySQL, SQL Server, or Oracle

Is It Secure?

The Agent only executes **read-only queries** (SELECT) and will not modify or delete your data. You can also restrict which tables and fields the Agent can access.

Advanced Note: The accuracy of Text to SQL depends on how clearly the table structure is defined. It is recommended to add Chinese descriptions to tables and fields to help the Agent understand what each field represents.

What Do I Need to Do?

Create a database connection — Select the database type and configure connection details

Set accessible tables — Choose which tables the Agent can query

Add field descriptions — Add descriptions to fields to improve query accuracy

Test queries — Test whether the Agent can query correctly using natural language

Attach to Agent — Link to the Agent as a tool

[Using Supabase for Text to SQL](#)

Agent Schedule

Agent scheduling concept

Agent Scheduling: Timed Trigger → Agent Auto-Executes → Results Delivered

What Is This?

Agent Scheduling lets an Agent execute tasks automatically on a set schedule without waiting for someone to ask a question. You provide a prompt, set a schedule, and the Agent runs on time and delivers results to the specified destination.

Think of it as setting an alarm clock for the Agent — when the time comes, it gets to work automatically.

When Do You Need This?

Periodic Reports: Compile yesterday's customer service summary every morning at 9 AM

Monitoring Checks: Check system status every hour and send notifications if anomalies are detected

Data Processing: Compile last week's sales data every Monday

One-Time Tasks: Execute a specific action at a designated time

Schedule Types

Type	Description	Example
Cron	Set precise times using Cron expressions	<code>0 9 * * 1-5</code> (Monday through Friday at 9 AM)
Interval	Execute at fixed intervals	Every 30 minutes, every 2 hours
One-Time	Execute once at a specified time	2026-04-15 14:00

Execution Modes

Mode	Description	Best For
Context Mode	Retains memory across executions; each run can continue from the previous one	Tasks that require accumulated information (e.g., continuous tracking)

Mode	Description	Best For
Independent Mode	Starts fresh each time with no memory from previous runs	Standalone repetitive tasks (e.g., daily reports)

Result Delivery

After execution, results can be sent to:

Conversation: Sent to a specified conversation on a messaging platform

Webhook: POST to your external URL (integrate with Slack, LINE, etc.)

Advanced Note: Agent Scheduling only supports AI assistants in Agent mode. When the schedule runs, the Agent uses your configured prompt as instructions and leverages all its attached tools and skills to complete the task.

What Do I Need to Do?

Select an Agent — Choose an existing Agent (must be in Agent mode)

Write a Prompt — Describe what the Agent should do each time it runs

Set the Schedule — Choose the schedule type and time

Configure Delivery — Decide where results should be sent

Enable — Turn on the schedule to start automatic execution

Next Steps

For complete step-by-step instructions, see [How to Set Up Agent Scheduling](#).

How to Set Up Agent Schedule

This page demonstrates how to create an agent schedule. If you're not yet familiar with what agent scheduling does, read [Agent Scheduling](#) first.

Prerequisites

Before creating a schedule, confirm the following:

You have created an AI assistant in Agent mode — Agent scheduling only supports AI assistants in Agent mode. Non-Agent mode assistants will not appear in the dropdown.

The AI assistant is connected to at least one conversation platform — The schedule uses a conversation platform as its container to run the Agent.

You have Agent Scheduling access — If you don't see the "Agent Scheduling" menu, contact your organization admin to check permission settings.

Navigate to Agent Scheduling

From the left menu, click [AI Features](#) → [Agent Scheduling](#). You'll see the schedule list:

Agent scheduling list page showing the status, type, delivery method, and last execution time for all schedules

Column descriptions:

Column	Description
Name	The schedule's identifier
AI Assistant	The AI assistant used by this schedule
Execution Mode	Context mode or independent mode
Schedule	Schedule type (Cron, interval, one_shot) and timing
Delivery	💬 = send to conversation, 🔗 = Webhook, <code>auto</code> = automatically created dedicated conversation
Last Execution	Time of the most recent execution
Status	Active Paused

Create a Schedule

1. Click New Schedule

Click the **New Schedule** button in the upper-right corner to open the form. The form has four tabs: **Basic Info**, **Prompt**, **Schedule Settings**, and **Delivery Settings**.

2. Fill in Basic Info

Basic Info tab: select AI assistant, name, execution mode, and conversation platform

Field	Required	Description
AI Assistant	✓	Select an existing AI assistant (only Agent mode assistants are shown)
Name	✓	The schedule's identifier, e.g., "Daily Customer Service Summary"
Execution Mode	✓	Choose context mode or independent mode
Conversation Platform	✓	The conversation platform container used during execution; context mode uses it to accumulate Agent memory (used internally — it won't appear in the customer service conversation list)
Save Results to Context	—	Only shown in context mode. Only affects memory for the next execution (doesn't affect whether you can view results — all past responses are retained on the execution log page)

How to choose the execution mode?

Context mode: Retains memory across executions. Suitable for tasks that need to accumulate information, such as continuously tracking complaint resolution progress or monitoring data trends.

Independent mode: Starts fresh each time with no previous memory. Suitable for standalone recurring tasks, such as daily reports or periodic statistics.

The AI Assistant, Execution Mode, and Conversation Platform fields cannot be changed after creation. To change them, you must delete the schedule and create a new one. Other fields (name, prompt, schedule time, delivery method) can be edited at any time.

3. Write the Prompt

Prompt tab: describe the task the Agent should complete each time it runs

In the prompt field, describe what the Agent should do **each time it runs**. The prompt is sent to the Agent as its instruction, and the Agent will use its attached tools and skills to complete the task.

Prompt example:

```
Query all unresolved customer complaints from the past 24 hours,  
sort them by priority, and compile a bullet-point summary.  
If there are any "High" priority cases, mark them with "⚠ Urgent".
```

Tips for writing prompts:

Clearly describe the task objective and output format

If you need the Agent to use a specific tool, guide it in the prompt (e.g., "Query the orders table in the database")

Avoid relying on external state beyond the current time; each execution should be an independent task (unless using context mode)

4. Configure Schedule Timing

Cron mode: use a standard 5-field cron expression to set precise timing

There are three schedule types:

Cron

Use a standard 5-field cron expression to set a precise schedule: `minute hour day month weekday` .

Expression	Meaning
0 9 * * 1-5	Monday through Friday at 9:00 AM
0 */2 * * *	Every 2 hours on the hour
30 8 * * *	Every day at 8:30 AM
0 0 1 * *	First day of every month at midnight

Must be paired with the "Timezone" field, which defaults to Asia/Taipei (Taipei time).

Interval

Execute once every fixed interval, configured by combining four fields — days/hours/minutes/seconds:

Interval mode: combine days, hours, minutes, and seconds fields

The interval must be **at least 1 second**

For example, to run "every 30 minutes," enter 30 in the "Minutes" field and 0 in all others

Interval mode does not use the timezone field (since it's a relative time, not an absolute time)

One-time

Execute once at a specified time, after which the schedule automatically ends:

One-time execution: select a specific date and time — the schedule ends after execution

Select a date and time precise to the second

Must be paired with the "Timezone" field

After execution, the schedule remains in the list for viewing records but will not run again

Other fields:

Field	Description
Enabled	Whether to activate the schedule immediately. When off, the schedule is "Paused" and won't trigger
Maximum Executions	Limit the maximum number of times the schedule runs; it will automatically pause when the limit is reached. Leave empty for unlimited

5. Configure Delivery

Where should the results go after execution? Configure this in this tab.

Delivery settings: configure multiple conversation targets and multiple Webhook URLs

This tab configures where results are actively pushed to (specified conversations, Webhook endpoints). Even if you don't set any delivery targets, the complete results of each execution are still retained on the [Execution Log](#) page — they just won't be actively pushed elsewhere.

Conversation

Click [Add Conversation](#) and select a conversation from the dropdown. Results will be sent as a bot message. You can add multiple conversations.

Webhook

Click [Add Webhook URL](#). Results will be sent as a POST request to your external URL (must start with `http://` or `https://`). Common use cases:

Integrate with Slack

Discord

LINE

Write to your own system for further processing

Trigger other automation workflows

It's fine not to set any delivery targets — execution results are always retained on the [Execution Log](#) page. But if you want your team/colleagues to passively receive results (e.g., push to Slack), you need to set at least one conversation or Webhook, otherwise no one will be notified.

6. Save and Enable

Click [Confirm](#) to save. If the "Enabled" toggle is on, the schedule will immediately start triggering according to the configured timing.

What Happens After Saving?

After the schedule is saved successfully, you'll immediately see the following:

The modal closes and the schedule appears in the list

Status shows "Active" (green tag), or "Paused" (if the enabled toggle was off)

The "Last Execution" column is empty until the first trigger, after which it updates with the execution time

The system does two things in the background (no UI changes visible, but happening behind the scenes)

Registers the schedule with the backend scheduler to automatically trigger at the configured time

Context mode also creates an internal system conversation container to accumulate Agent memory (this container won't appear in the [Customer Service Conversations](#) list)

Wait for the schedule to trigger

Cron

Interval: Executes automatically at the configured time, e.g., cron `0 9 * * 1-5` triggers at the next Monday–Friday 9:00 AM

One-time: Executes once at the configured time

Don't want to wait? Click the [▶ Run Now](#) button in the list to trigger an immediate execution for testing

During execution

The list status remains "Active," and the "Last Execution" column updates with each run

Each execution creates a record on the [Execution Log](#) page (with the complete Agent response)

If you added conversations or Webhooks in "Delivery Settings," results are also sent to those targets

For details on where to view results, see [Where Do Results Go?](#) below

When the task ends

Reaches the "Maximum Executions" limit → automatically switches to "Paused" and stops triggering
One-time execution completes → the schedule remains in the list but won't trigger again

Where Do Results Go?

After a schedule runs, the Agent's response appears in the following locations. **The Execution Log page is the primary entry point for viewing history** — regardless of execution mode, every run leaves a complete record here. Other locations depend on your delivery settings.

1. Execution Log Page (Primary Entry Point)

Each execution generates a record. This is the most reliable way to view historical results.

How to access:

Agent Scheduling list → Click  **View Execution Log** on the schedule's row → Enter the execution history page → Click  **View Details** on a specific record

You'll see:

Execution status (Success

Failed

Partial Success)

Start time, completion time

Complete Agent response (even if subsequent delivery failed, the content is still preserved here)

Error messages on failure

2. Your Specified Conversations (Conversations Added in Delivery Settings)

Execution results are sent as Agent messages into these conversations, just like messages seen by customers/colleagues.

How to find:

Customer Service Conversations → Enter the conversation you added in delivery settings → The message will be at the latest position.

3. Webhook URLs (URLs Added in Delivery Settings)

Execution results are sent as HTTP POST to your external URL. **Body is JSON:**

```
{
  "content": "Complete response content generated by the Agent"
}
```

Technical details:

Content-Type: `application/json`

Timeout: 30 seconds (the Webhook endpoint must respond with 2xx within 30 seconds, otherwise it's treated as failed)

Failures are recorded in the execution log's "Error Message" field (execution log status becomes "Partial Success"), but no retry is attempted

What Does the "Save Results to Context" Toggle Do?

This toggle **only affects the memory for the next execution in context mode** — it doesn't affect whether you can view results.

Setting	Effect on Next Execution
On (default)	The previous prompt and Agent response are carried forward as conversation history for the next run, allowing the Agent to continue the context
Off	No messages are retained per execution, effectively behaving like independent mode

Regardless of the toggle state, **the Execution Log page always retains the complete response from each run** — this toggle doesn't affect your ability to view history.

Summary: Results Visibility Reference Table

Execution Mode Setting	Execution Log	Specified Conversations	Webhook	Agent Cross-run Memory
Context mode + Save results to context (default)	✓	✓ If configured	✓ If configured	✓ With memory
Context mode + Don't save results	✓	✓ If configured	✓ If configured	✗ No memory
Independent mode	✓	✓ If configured	✓ If configured	✗ No memory

Why is there no "Dedicated Conversation" entry point? Context mode creates a dedicated backend conversation to accumulate memory, but this conversation currently does not appear in the **Customer Service Conversations** list — it's an internal system container, not a conversation for human agents to handle. To view historical results, go to the **Execution Log**.

Full Example: Daily Customer Service Summary

Below is an end-to-end example showing how to create a schedule that automatically compiles the previous day's customer service summary every morning at 9:00 AM and sends the results to Slack.

Scenario

Every morning before work, you want the AI assistant to compile all unresolved complaints from yesterday, create a summary, and send it to the team's Slack #customer-support channel so the customer service manager can see it as soon as they open Slack.

Preparation

- An AI assistant in Agent mode, with tools attached that can query complaint data (e.g., database tool or customer service system API tool)
- A connected conversation platform (as the schedule's execution container)
- A Slack incoming webhook URL (to receive results)

Configuration

Basic Info:

Field	Value
AI Assistant	Customer Service AI Manager
Name	Daily Complaint Summary - 9:00
Execution Mode	Independent mode (compile independently each day, no need to remember the previous day)
Conversation Platform	Internal Customer Service

Prompt:

```
Query all customer complaints with status "Unresolved" or "In Progress"
from the past 24 hours (ending at today's midnight),
sort by priority (High → Medium → Low) and compile a summary:
```

```
## Format
```

```
### 🟡 High Priority (X cases)
```

```
- [#Case ID] Customer Name – one-line description
```

```
### 🟡 Medium Priority (X cases)
```

```
...
```

```
### 🟢 Low Priority (X cases)
```

```
...
```

```
End with a summary line: "Total X cases pending, of which X high-priority cases
need to be handled today."
```

Schedule Settings:

Schedule type: **Cron**

Cron expression: **0 9 * * 1-5** (Monday through Friday at 9:00 AM)

Timezone: **Asia/Taipei**

Enabled: On

Maximum executions: Leave empty (run continuously)

Delivery Settings:

Conversation: Don't add extra conversations (the Execution Log page already retains the Agent's complete output — no need to send it to a customer service conversation and take up space)

Webhook URL: <https://hooks.slack.com/services/T000000000/B000000000/XXXXXXXXX>

After Saving

Monday at 9:00 AM (first trigger): The schedule triggers automatically and the Agent starts querying and compiling

Within ~30 seconds (depending on Agent processing speed):

The team's Slack #customer-support channel receives the summary via Webhook push (POST body is `{"content": "..."}`)

The "Last Execution" in the schedule list updates to **2026-04-20 09:00:12**

Want to review what the Agent produced? Two places:

Execution Log page (primary entry): **Agent Scheduling** → Click the schedule's ⌚ → Click 👁 → View the complete bot response and token usage

Slack: Go directly to the #customer-support channel (this is the Webhook endpoint you configured)

Tuesday, Wednesday... ongoing execution: Triggers automatically every weekday at 9:00 AM with no further human intervention needed

Troubleshooting

Slack didn't receive a message → First check the Execution Log page to confirm the execution status. If "Failed," check the error message. If "Success" but Slack didn't receive it, verify the Webhook URL is correct and check for Slack rate limits

Summary content doesn't match expectations → Check the Agent's actual output in the execution log details, then adjust the prompt

Schedule didn't trigger → See the "FAQ" section below

Manage Existing Schedules

Back in the schedule list, the action area on the right side of each row provides these functions:

Icon	Function	Description
	Edit	Modify schedule content (except AI Assistant, Execution Mode, and Conversation Platform)
	View Execution Log	Enter the schedule's execution history page
	Run Now	Trigger an immediate execution without waiting for the scheduled time
 	Pause Enable	Toggle the schedule's active status
	Delete	Delete the schedule. Execution logs are also removed

Run Now

"Run Now" is the fastest way to test if a schedule is configured correctly. After clicking:

The system triggers an immediate execution without affecting the original schedule timing

A "Schedule triggered" notification appears

Check "View Execution Log" to observe the execution results

Pause and Enable

After pausing, the schedule won't trigger, but settings and execution logs are preserved. You can re-enable it at any time.

View Execution Logs

Click the  icon in the list to enter the execution log page:

Execution Log page: filter by status and date range, and view results of each execution

Filters

Status: Pending

Running

Success

Failed

Date Range: Specify start and end dates

Column Descriptions

Column	Description
Status	Pending (queued), Running, Success, Failed
Start Time	When the Agent started execution

Column	Description
Completion Time	When execution ended
Error Message	If execution failed, displays the error reason
Bot Response	Response content generated by the Agent (full content available in details)

View Execution Details

Click the 👁 icon on the right side of each row to open the details modal, where you can view the complete bot response and error messages:

Execution details: status, start/completion time, complete bot response, and error messages

FAQ

- ▶ Why didn't the schedule trigger?
- ▶ Why can't I find my AI assistant in the dropdown?
- ▶ The schedule ran — where do I see what the Agent produced?
- ▶ After turning on "Save Results to Context," where do I see that conversation?
- ▶ What's the data format received by Webhook?
- ▶ Independent mode vs. context mode — what's the actual difference?

Further Reading

Agent Scheduling — Conceptual introduction to agent scheduling

Agent (AI Assistant) — Create an AI assistant in Agent mode

Platform Integration: Website — Set up a conversation platform (using website as an example)

Tools

Tools concept

Tools: Agents call external services through Function Calling

What is this?

Tools enable Agents to "take action" — calling external services to perform actions or retrieve real-time information.

An Agent without tools can only answer questions using its existing knowledge. With tools, it can check live weather, create a customer record in a CRM, send emails, or fetch the latest data from third-party APIs.

How are tools different from skills?

	Tools	Skills
Nature	A callable external service	A multi-step reasoning workflow
Granularity	Single action (e.g., "check weather", "send email")	Multi-step SOP (e.g., "complete quotation process")
Who decides when to use it	The Agent determines when to call it	The Agent triggers the workflow within a skill based on context
Does it use tools	A tool is the smallest unit itself	A skill can chain multiple tools together

Quick rule of thumb: If it's a single capability (query data, perform an action), make it a tool. If it's an entire workflow (first query A, then decide whether to do B), make it a skill.

Tool Types

API Tool

Directly calls a REST API. You configure the URL, HTTP method, and parameters, and the Agent can use it during conversations.

Best for: Internal company APIs, third-party service APIs, simple HTTP requests

MCP Tool

Connects to external services through MCP (Model Context Protocol). MCP is a standardized protocol that allows Agents to integrate with various services more easily.

Best for: Services that already have an MCP Server, external integrations requiring more complex interactions

Built-in Tool

Tools provided by MaiAgent by default, such as AI image generation. No additional configuration required.

Advanced note: Tools are powered by Function Calling technology under the hood. The Agent determines whether to call a tool based on the conversation context, automatically assembles parameters, sends the request, interprets the returned results, and replies to the user in natural language.

What do I need to do?

Create a tool — Choose the type (API MCP) and configure the connection details

Define parameters — Describe the tool's purpose and parameters so the Agent knows when to use it

Test — Verify the tool can be called and returns results correctly

Attach to an Agent — Configure this tool in the Agent settings

Further Reading

[Tool Feature Overview](#)

[Create an MCP Tool](#)

[Create an API Tool](#)

[Built-in AI Image Generation Tool](#)

[Configure Tools for AI Assistants](#)

Quick Menu

The quick menu is a type of Agent UI. It remains in the Web Chat input bar, allowing visitors to start with one of 2–6 menu items without entering text first. Each item can send a message, insert text into the input field, or open an external link.

The quick menu appears only in Web Chat. It does not appear on other platforms such as LINE, Microsoft Teams, or backend test conversations.

Use Cases

An e-commerce business wants visitors to be able to choose "Track Order," "Returns and Exchanges," or "Contact Support" as soon as they open the customer service window. An administrator creates a quick menu and configures the first two items to send the corresponding questions and the third item to insert "I want to contact support" into the input field. After selecting an item, visitors can enter the appropriate service flow immediately without having to guess what to ask.

Create a Quick Menu

Go to [AI Features](#) → [Agent UI](#), click Add, and then select [Quick Menu](#).

Select "Quick Menu" to begin setup

Enter a **Display Name**, **Tool Name**, and an optional description. The tool name is used by the AI, so use an English name that follows the naming conventions.

Under **Appearance**, select Grid or List. To show the full menu immediately when visitors enter the chat, enable **Expanded by Default**.

Configure 2–6 menu items and select an action for each item. The **Preview** on the right displays how the menu will appear in Web Chat in real time.

Quick Menu editor and real-time preview

After confirming the preview, click **Save** in the upper-right corner.

Add the Quick Menu to an AI Assistant

The quick menu does not automatically appear in Web Chat after it is saved. You must also attach it to an AI assistant that uses Agent mode.

Go to **AI Features** → **AI Assistants**, and open the assistant that will use the quick menu.

Confirm that the assistant's response mode is **Agent Mode**. If it is not, the "Agent UI" section prompts you to switch modes first.

In the assistant settings, click **Agent UI**, and then click **Select Agent UI**.

Select the quick menu you just created and confirm your selection, then save the AI assistant. Reopen the assistant's Web Chat to use the quick menu in the input bar.

Differences Between the Three Actions

Action	Result After Selection	Best For
Send Message	Sends the configured prompt directly to the AI; the button text is displayed in the conversation	Frequently asked questions and predefined service flows
Fill Input Field	Inserts text into the input field so visitors can edit it before sending	Adding an order number or issue details
Open Link	Opens the specified URL	Visiting the official website, a form, or an external service page

The button text for "Send Message" can differ from the prompt sent to the AI, but they should convey the same meaning to prevent discrepancies between the option visitors see and the request the AI actually receives.

Appearance and Icons

Grid menus are arranged automatically based on the number of items, while lists are better suited to items with longer text. Each item can have no icon, use an emoji, or display an uploaded image. When no icon is set, the menu uses the first character of the button text as its identifier.

If the menu opens an external link, make sure the URL uses HTTPS and regularly check that the link remains accessible.

Code Interpreter (Code Execution)

What Is This?

Code Interpreter lets an Agent execute Python code in a **secure sandbox environment**, completing tasks programmatically.

With Code Interpreter enabled, the Agent can do more than just reply with text — it can write code to perform calculations, process files you upload, generate Word/PowerPoint/Excel documents, and return the results for you to download.

How Is It Different from Tools?

	Tools	Code Interpreter
Nature	Calls pre-defined external APIs	Writes and executes Python on the fly in a sandbox
Flexibility	Limited to what the API provides	Anything Python can do
Typical use cases	Send emails, query CRM, integrate third-party services	Computation, data processing, file generation, charting

Quick rule of thumb: Need to call an external API → Tools; need to compute, process files, or generate documents → Code Interpreter.

What Can It Do?

Data analysis & computation: CSV/Excel calculations, statistics, pivot tables, data cleaning

Chart creation: Turn data into line charts, bar charts, pie charts, and more

Document generation: Produce Word, PowerPoint, Excel, and PDF files for download

File processing: Parse PDFs, convert formats, batch-process uploaded files

Sandbox Environment

The execution environment is a **secure sandbox**, isolated from production systems — it won't affect any other data

Supports standard Python along with common data and document processing packages

Files generated by the Agent appear in the **Output** panel within the chat interface and can be downloaded directly

When to Use

Finance/sales teams ask the Agent to organize Excel files and produce weekly reports

HR/admin teams ask the Agent to turn survey results into charts and generate PowerPoint presentations

Legal/contract teams ask the Agent to extract key fields from PDFs and output Word summaries

Any conversation scenario that requires ad-hoc computation or on-the-fly file generation

What Do I Need to Do?

Go to Agent settings — Open the settings page of the AI Assistant you want to enable it for

Enable Code Interpreter — Turn it on in the tools or advanced capabilities section

Test — Ask the Agent to perform a task that requires computation or file generation in a conversation, and verify that the Output panel allows normal downloads

Browser Tool (Browser Operations)

What Is This?

Browser Tool lets an Agent **control a browser**: navigate to web pages on its own, click buttons, fill out forms, scroll the page, and take screenshots to "see" what's currently displayed before deciding what to do next.

This capability is also commonly referred to as **Browser Use** or **Computer Use** in the industry. Common related terms include “browser tool,” “browser operations,” “browser automation,” and “web automation.” MaiAgent's Browser Tool is a built-in version integrated directly into the Agent — once enabled, it can be used right within a conversation without connecting any external services.

What Can It Do?

Navigate & explore: Open a specified URL, follow links across pages

Interact with page elements: Click, double-click, type text, press keys, scroll

Visual understanding: Captures a screenshot after each action; the Agent reads the screen to decide the next step

Multi-step tasks: Sequential workflows like login → search → filter → retrieve data

How Is It Different from Tools and Code Interpreter?

	Tools (API MCP)	Code Interpreter	Browser Tool
Acts on	Backend services APIs	Sandbox programming environment	Real browser & web pages
Can see the screen?	No (JSON responses only)	Can see sandbox output	Yes (screenshots)
Best for	Structured data queries, well-defined API calls	Computation, file processing, document generation	Services with a web UI but no API

Quick rule of thumb: The target has an API → Tools; you need to compute or generate files → Code Interpreter; you can only interact via a web page → Browser Tool.

When to Use

Internal systems with no public API but a Web UI you can operate
Scraping information from third-party websites that require login or interaction
Automating multi-page, multi-step web workflows (search, filter, download)
Anything "a person would do in a browser" that you want the Agent to handle automatically

Caveats

Optimized for Claude models: Browser Tool relies on model capabilities for interpreting visual screenshots. It works best with the Claude series; other models may produce inconsistent results.

Same-origin pages work best: Cross-domain iframes and pages with strict CSP may have limited interactivity.

Execution takes time: Each step requires loading the page, taking a screenshot, and reasoning. Multi-step tasks will be slower than a single API call — design your scenarios accordingly.

What Do I Need to Do?

Go to Agent settings — Open the settings page of the AI Assistant you want to enable it for

Enable Browser Tool — Turn it on in the tools or advanced capabilities section

Use a Claude model (recommended) — For the best visual interpretation results

Test — Ask the Agent to perform a task that requires web interaction in a conversation, and verify that the browser panel displays and interacts correctly

Voice Agent

What Is This?

Voice Agent enables AI Assistants to interact through **voice**: users speak, and the AI responds by speaking back. It integrates real-time voice models, STT (Speech-to-Text), TTS (Text-to-Speech), and interruption control under the hood, making it suitable for phone customer service, IVR, voice assistants, and similar scenarios.

Once enabled, the AI Assistant gains a "Voice Call" interface where users can tap the microphone to start a conversation.

Three Interaction Modes

Different modes suit different needs, depending on latency, voice customization flexibility, and tool support.

Mode	How It Works	Best For
Realtime	Uses a voice model for direct real-time voice conversation	Scenarios requiring the lowest latency where the default voice is acceptable
Realtime + TTS	Real-time voice model paired with custom TTS output	Scenarios needing a custom brand voice while maintaining a real-time feel
STT + LLM + TTS	Traditional pipeline: Speech-to-Text → LLM → Text-to-Speech	Scenarios requiring full tool support, where slightly higher latency is acceptable and maximum flexibility is desired

Quick decision: For the fastest and most natural experience → Realtime; for a branded voice → Realtime + TTS; for maximum flexibility and tool support → STT + LLM + TTS.

Interruption Control (Turn Handling)

A critical aspect of the voice conversation experience — can the user interrupt the AI while it's speaking? How does the system determine whether the user is actually speaking versus background noise or filler words?

Adjustable parameters:

Parameter	Description
Minimum speech duration (seconds)	The user's speech must last at least this many seconds to be recognized as "I want to interrupt"
Minimum word count	The user must say at least this many words to trigger an interruption

Note: `min_duration` and `min_words` are only effective in **STT + LLM + TTS** mode. In Realtime mode, interruption detection is handled internally by the voice model.

Conversation States

During a voice conversation, the interface displays the current state:

- Listening:** The AI is receiving the user's voice input
- Thinking:** The AI is processing (searching the knowledge base, using tools, generating a response)
- Responding:** The AI is replying with voice output
- Initializing:** The connection has just been established and is being prepared

How Is This Different from Text Chat?

	Text Assistant	Voice Agent
Input	Keyboard typing, file attachments	Microphone voice input, possibly DTMF key presses
Output	Text, Markdown, images, files	Voice, with a text transcript appended afterward
Latency requirements	Seconds-level is acceptable	Must be milliseconds-level to feel natural
Best for	Detailed information needs, reviewing conversation history	Immediate responses, hands-busy situations, phone channels

Best Use Cases

- Phone customer service:** Replace traditional IVR — AI directly answers calls, listens to questions, and provides answers
- Voice query systems:** Customers call to check orders, balances, or insurance policies
- Voice FAQ:** Common questions answered by simply speaking

Driving

hands-busy scenarios: Users can't type but need AI assistance

Accessibility needs: More friendly for users who have difficulty typing

Limitations

Tool support: Currently, **Realtime** and **Realtime + TTS** modes only support **MCP Tools**; to use API Tools, switch to STT + LLM + TTS mode

Knowledge base search: Voice Agent searches all linked knowledge bases and **cannot be restricted to specific documents only**

Microphone permissions: Users must grant browser microphone access before the conversation can begin

What Do I Need to Do?

Go to AI Assistant settings — Navigate to the settings page of the Agent you want to enable voice for

Select voice agent mode — Choose one of the three: Realtime

Realtime + TTS

STT + LLM + TTS

Configure provider and settings — Select the corresponding STT

TTS

Realtime provider and JSON configuration for your chosen mode

Adjust interruption control (optional) — In STT + LLM + TTS mode, adjust minimum duration and minimum word count

Test — Open a voice call in the interface and confirm that the Listening, Thinking, and Responding states all work smoothly

[Voice Call Quality Inspection](#)

Skills

Skills concept

Skills: Define multi-step SOPs for Agents to follow during conversations

What Is This?

A skill is a multi-step reasoning workflow for an Agent. You define an SOP in natural language, and the Agent follows this workflow step by step when it encounters a relevant scenario in conversation.

If tools are an Agent's "individual capabilities," skills are "chaining multiple capabilities into a complete workflow."

An Example

Suppose you want your Agent to handle "customer quotes":

Without skills: The Agent might give scattered responses and miss important information.

With skills: You define a quoting SOP —

- 1. First confirm the product model the customer needs
- 2. Look up the product price list (using a tool)
- 3. Confirm the customer's quantity requirements
- 4. Apply discount rules based on quantity
- 5. Generate a quote summary
- 6. Ask the customer if adjustments are needed

The Agent follows this workflow to guide the conversation, ensuring no step is missed.

What Can Be Used Inside a Skill?

Skills can reference tools and knowledge bases already mounted on the Agent, so data lookups or action execution during the workflow happen automatically.

Combination	Description
Tools	Used when the skill workflow needs to call external services

Combination	Description
Knowledge Base	Used when the skill workflow needs to look up reference materials
Resource Files	Skills can include reference documents that the Agent can consult during execution

When Should You Use Skills?

Workflows with fixed SOPs: Quoting, complaint handling, problem diagnosis

Multi-turn information gathering: Booking workflows (need to ask for date, time, number of people)

Conditional branching: Taking different processing paths based on different situations

Ensuring no steps are missed: Form-filling guidance, review workflows

When Don't You Need Skills?

Simple Q&A (a knowledge base is sufficient)

Only need to look up one piece of data or perform one action (just use a tool)

Advanced Note: Skills are defined as plain-text prompts, not flowcharts or code. This means you can describe an entire workflow in natural language, and the Agent will understand and execute it. Skills also support uploading resource files as supplementary references.

What Do I Need to Do?

Create a skill — Write manually or upload a skill definition file

Describe the workflow — Write out the complete processing steps in natural language

Attach resources — Add reference documents or tools if needed

Mount to an Agent — Enable this skill in the Agent settings

Test — Simulate user conversations to verify the workflow runs smoothly

Crawler

Crawler concept

Crawler: Automatically scrape web content and import it into the Knowledge Base

What Is This?

The crawler automatically scrapes content from web pages and imports it into the Knowledge Base. Simply provide a URL, and it will crawl the text content of that page (or the entire website) and convert it into knowledge that the Agent can reference.

When Do You Need It?

Website content: Automatically import product descriptions and service information from your company website

Public information: Scrape publicly available web pages such as regulations, announcements, and technical documents

Continuous updates: When website content changes, periodically re-crawl to keep the Knowledge Base up to date

Relationship Between Crawler and Knowledge Base

The crawler is **one of the data sources** for the Knowledge Base. Its role is:

The content scraped by the crawler ultimately enters the Knowledge Base. The Agent does not interact with the crawler directly.

What Do I Need to Do?

Enter a URL — Tell the crawler which web page or website to scrape

Set the scope — Scrape a single page only, or recursively crawl subpages

Run the crawl — Start the crawler and wait for it to complete

Import into Knowledge Base — Import the crawl results into a specified Knowledge Base

Verify the content — Check whether the imported content is correct and complete

Further Reading

[How to Use the Crawler \(Scrape Data\) Feature](#)

I Want to Do X, What Should I Use?

Decision Guide

Scenario → Module Mapping: Quickly Find the Right Starting Point

Not sure which module to use? Start from your need and find the right starting point.

Scenario Comparison Table

Let the Agent Answer Questions

I want to...	Use	Why
Let the Agent answer product-related questions	Knowledge Base	Upload product manuals so the Agent can find answers
Let the Agent answer frequently asked questions	Knowledge Base (FAQ)	Create FAQ pairs for precise matching of common questions
Let the Agent check order status	Database	Orders are in structured tables, requiring Text to SQL
Let the Agent query real-time information (weather, exchange rates)	Tools	Needs to call external APIs to get real-time data

Let the Agent Take Action

I want to...	Use	Why
Let the Agent send notification emails	Tools	Integrate with an Email API; the Agent triggers the send
Let the Agent create customer records in CRM	Tools	Integrate with a CRM API; the Agent executes the creation
Let the Agent handle complaints following an SOP	Skills	Define a complete workflow to ensure no steps are missed
Let the Agent guide customers through booking	Skills	Multi-turn conversation to collect information, following a defined process

Let the Agent Automate

I want to...	Use	Why
Automatically generate a report every morning	Agent Scheduling	Set a scheduled execution to automatically deliver results
Check system status every hour	Agent Scheduling	Set an interval execution, combined with Tools to check status
Automatically import website content into the Knowledge Base	Crawler	Scrape web content and import it into the Knowledge Base

Common Module Combinations

Most scenarios don't use just a single module. Here are common combinations:

Smart Customer Service

Agent + Knowledge Base + FAQ

The most basic and common combination. The Agent uses the Knowledge Base to answer product questions, and FAQ handles high-frequency questions.

Business Assistant

Agent + Knowledge Base + Database + Tools

Can look up product information (Knowledge Base), check inventory and pricing (Database), and help customers place orders (Tools).

Automated Reporting

Agent + Tools + Agent Scheduling

The Agent uses Tools to retrieve data, Agent Scheduling triggers it on a timer, and results are automatically pushed to Slack or LINE.

Process-Guided Bot

Agent + Skills + Tools + Knowledge Base

Skills define the complete SOP. During the process, the Agent queries the Knowledge Base for reference materials and uses Tools to execute actions.

Still Not Sure?

Start with the simplest setup: **Agent + Knowledge Base**. Get the Agent answering questions first, then decide what capabilities to add based on actual user feedback after going live.

AI Assistant

AI Assistant Features

Purpose and Use Cases of AI Assistants

AI assistants can be widely applied across diverse industries and use cases, helping enterprises automate repetitive tasks and improve operational efficiency, allowing teams to focus on high-value work and core strengths.

Below are common examples of AI assistant applications in enterprise workflows:

AI assistants can be applied across various industries, leveraging intelligent automation and real-time interaction to help enterprises optimize processes, improve service quality, and enhance user experience. The following table lists common AI assistant use cases by industry for reference.

Industry	Use Cases
E-commerce & Retail	Intelligent customer service, product recommendations, return process handling
Finance & Insurance	Policy inquiries, financial planning recommendations, risk Q&A
Education	Course teaching assistant, learning diagnostics, language practice

Industry	Use Cases
Healthcare	Health consultations, appointment scheduling, patient education support
Government	Public service inquiries, policy Q&A, public feedback
Manufacturing	Internal knowledge management, maintenance operation guides
Travel & Tourism	Itinerary recommendations, guided tours, real-time Q&A support

Four Stages of MaiAgent AI Assistant Setup

The MaiAgent AI assistant setup process consists of four stages. Below is a brief description of the goals and features for each stage. Complete step-by-step instructions are provided in the following sections.

1. Create a New AI Assistant

Customize the AI assistant to your needs: select an appropriate language model, connect a knowledge base for RAG (Retrieval-Augmented Generation) in [Knowledge Base Settings](#), and define the assistant's role and tasks to build an intelligent assistant suited to your business.

On the AI assistant's [Settings](#) page, the left menu groups options under [Basic](#), [Knowledge & Data](#), [Capability Extensions](#), [Interface & Experience](#), and [Management & Advanced](#). These include [Basic Settings](#), [Response Mode Settings](#), [Knowledge Base Settings](#), and [Permission Settings](#).

AI assistant Settings page and groups in the left menu

2. Provide Reference Materials for the AI Assistant

Build a solid knowledge foundation for the AI assistant by configuring a **Knowledge Base**, creating **FAQ** entries in it, or using a **Crawler** to import webpages. This further improves the accuracy and usefulness of responses.

3. Launch the AI Assistant

Decide whether to make the AI assistant publicly available or restrict it to internal use. The **Conversation Platforms** tab offers three built-in entry points: **Web Widget** (public, with embed code for your company website), **Internal Chat** (internal), and **API**. To serve customers through LINE, Messenger, or other channels, click **Connect Channel** to integrate with your existing platforms.

Built-in channels and Connect Channel on the Conversation Platforms tab

4. Track AI Assistant Performance

Use **All Conversations**, the AI assistant's **Usage Analytics** (including monitoring metrics such as response quality scores), and **Webhook** to track performance and guide ongoing improvements to the assistant and user experience.

Before you start building an AI assistant, consider reading these helpful articles!

 [How to Choose an LLM \(Large Language Model\)?](#)

 [What is RAG \(Retrieval-Augmented Generation\)?](#)

 [What Are Role Instructions?](#)

Create an AI Assistant

1. Create an AI Assistant

Go to **AI Features** in the left sidebar, then select **AI Assistant**, and click **+ Create AI Assistant** in the upper right corner.

2. Name Your AI Assistant

Select the "Basic Settings" tab, and enter the name of your AI Assistant in the **AI Assistant Name** field. You can name it based on its primary task, such as XX AI Customer Service, XX Regulation Inquiry Helper, or XX Project Smart Assistant.

A single account can create multiple AI Assistants (subject to quantity limits based on your subscription plan).

3. Select RAG to Make Your AI Assistant Smarter and More Accurate

What Is RAG

Think of RAG as a combination of "a conversational assistant + a skilled librarian who excels at finding information."

A standard AI Assistant is like a person with excellent memory who is great at storytelling, but can only share knowledge they have previously learned. However, when an AI Assistant is equipped with RAG technology, it is like this assistant **goes to the library to find the latest information** before answering a question, then organizes the findings into its own words and delivers a clear response.

In the MaiAgent platform, this "library" is our **Knowledge Base**. The AI Assistant uses RAG technology to retrieve relevant information from the Knowledge Base, making responses more accurate, timely, and tailored to your needs.

The Knowledge Base setup will be explained in detail in the next section.

MaiAgent RAG not only incorporates the RAG technology mentioned at the OpenAI Developer Conference but also combines various classic NLP algorithms with proprietary retrieval techniques. Based on internal datasets compared with OpenAI RAG response accuracy, both achieve 95% response precision.

RAG Settings

Select the **RAG Settings** tab, and choose a different RAG (Retrieval-Augmented Generation) from the **RAG** dropdown menu. If you have no special requirements, **the default is MaiAgent RAG**.

Compared to OpenAI RAG, MaiAgent RAG offers more additional features, can be flexibly applied to different deployment needs, handles more diverse data processing formats, and provides a more powerful retrieval and generation experience. For a detailed comparison, see [What Is RAG? Comparison Between MaiAgent RAG and OpenAI RAG](#)

Configure FAQ Priority Response

To ensure the accuracy and consistency of your AI Assistant's responses, you can enable the "FAQ Priority Response" feature. When this feature is enabled, if both FAQ content and other document content exist in the Knowledge Base, the LLM will prioritize using FAQ content to answer questions, ensuring responses align with your established standard answers.

Feature Benefits:

Improved response accuracy: When both FAQ and other documents exist in the Knowledge Base, verified FAQ content is used first, reducing potentially inaccurate AI-generated answers

Ensured response consistency: All users receive the same standard FAQ answers, maintaining service quality

Reduced hallucination risk: FAQ standard answers are referenced first, preventing the AI from generating fabricated or incorrect information

Setup Steps:

Select the **Response Mode Settings** tab

In the **System Prompt** field, enter the following instruction:

Please prioritize using FAQ content to answer user questions

基本設定

回答模式設定

知識庫設定

工具

權限設定

進階設定

回答模式

☐

RAG 問答

反應快速，通常 2 秒內輸出答案，適合簡易客服與資訊查詢，無法調用外部工具

☒

請優先使用faq的內容回答使用者問題

資料庫 URL

請選擇

請輸入

After enabling this feature, when both FAQ content and other document content exist in the Knowledge Base, the AI Assistant will prioritize using FAQ content to answer questions. If no relevant FAQ content is found, the AI Assistant will still respond based on other Knowledge Base documents or general knowledge.

4. Select a Model to Give Your AI Assistant a Smart Brain!

Purpose of Language Model Selection

The performance of each AI Assistant largely depends on its brain -- the language model (LLM) it uses. In this step, you can choose different types of models based on your needs, which will affect response speed, comprehension ability, and the depth and naturalness of answers.

Choosing the right model is like enabling high-performance mode for your AI Assistant, providing the best experience tailored to your use case!

Key Factors When Choosing a Large Language Model

Language Model Settings

Select the **Basic Settings** tab, and choose a different large language model from the **LLM Model** dropdown menu. If you have no special requirements, **the default is Claude 4.5 Haiku**.

5. Create a System Prompt for Your Use Case

To make your AI Assistant better suited to different application needs, you can set up a "System Prompt" to make the AI's response style and content more aligned with the scenario.

[What Is a System Prompt? System Prompt Example Templates? AI Tool for Generating Role Assistants](#)

Hallucination-Free Generative AI Response Mechanism

MaiAgent's "Hallucination-Free Generative AI Response Mechanism" ensures high accuracy when the AI answers questions. When facing uncertain or out-of-scope questions, it honestly expresses its limitations rather than generating fabricated answers, providing users with a more reliable and trustworthy AI interaction experience. The importance for various industries and public sector applications is described below:

Industry Applications

Financial Industry:

When handling investment advice and risk assessments, the AI must provide analysis based on verified data, avoiding false information that could lead to incorrect investment decisions. When information is insufficient or uncertain, the system clearly states so, ensuring the reliability of investment decisions.

Healthcare Industry:

When assisting with medical diagnosis and drug consultation, the AI system must strictly follow established medical knowledge and must not generate suggestions that could mislead patients. For novel or unverified medical information, the system clearly indicates that further professional consultation is needed.

Manufacturing Industry:

In applications such as production process optimization and quality control, the AI must provide recommendations based on actual production data and verified methods, avoiding production losses due to inaccurate predictions.

Education Industry:

When assisting with teaching and answering student questions, the AI needs to provide accurate knowledge rather than incorrect information that could mislead learning. For complex or ambiguous concepts, the system honestly acknowledges its understanding limitations.

Legal Industry:

When providing legal information and advice, the AI must be based on existing regulations and case law, rather than offering speculative advice that may carry legal risks. The system clearly identifies matters that require further confirmation by a professional lawyer.

Customer Service:

When handling customer inquiries, the AI must provide accurate product information and service descriptions. For questions that cannot be confirmed, it immediately refers them to relevant professionals, avoiding customer misdirection.

Public Sector Applications

Government Policy Consultation:

When providing citizens with policy information and service guidelines, the AI must answer based on the latest and correct regulations and administrative procedures, avoiding outdated or incorrect information. When encountering complex questions requiring professional judgment, the system clearly advises citizens to seek assistance from the relevant department.

Public Service Decision-Making:

When assisting government in evaluating public infrastructure and social welfare decisions, the AI must analyze based on real data and research. Uncertain predictions must be clearly stated to ensure the reliability of policy-making.

Emergency Response Management:

When handling natural disasters, public health, and other emergencies, the AI system must provide accurate information and guidance. It must not generate false information that could mislead the public and affect disaster response effectiveness.

Select the Appropriate Response Mode to Build Prompts

Select the **"Response Mode"** tab. From free-form conversation to highly structured responses, it meets various business needs. Each mode has its own features and applicable scope, and you can flexibly choose based on your actual use case.

Response Mode: General

Applicable Scenarios

The AI answers freely based on the question, generating the most suitable response according to context and Knowledge Base content. Suitable for most Q&A scenarios.

Operation Steps

Select the **Response Mode Settings** tab, choose **"General (Default)"** as the response mode, and enter the System Prompt you have defined for this AI Assistant in the **System Prompt** field. For the output format, you can choose to output plain text or JSON format.

Use Case: Website Customer Service Assistant

To create a website customer service assistant for "MaiAgent - AI Assistant Development Platform," you can enter the AI's response settings in the "System Prompt" field, clearly defining its response style and scope of responsibilities.

Response Mode: Template

When you select **Response Mode: Template**, the probability of hallucinated responses from your AI Assistant is reduced to zero, because the AI Assistant will strictly reply based on the Knowledge Base and

FAQ content you have created, using a classification-based approach to answer questions rather than having the LLM generate content. It uses a template system to generate answers, guaranteeing 100% hallucination-free responses.

Applicable Scenarios

Scenarios requiring unified response formats, such as standard consultation processes and reports.

Case Study

Suppose you want to create a "Tainan City Government 1999" Customer Service AI Assistant to respond to citizens' municipal-related questions in real time.

1. Select the **Response Mode Settings** tab, and choose **"Template"** as the response mode

2. Fill in the Response Template (using the template system to generate answers)

If you have not yet created a Knowledge Base and FAQ, the default response template instructions are as follows.

It is recommended to first create a Knowledge Base or FAQ to use the response template, and the format **must be tabular files such as Excel, CSV, json, or jsonl**.

回應範本
請將範本內容填滿後，再按「儲存範本」。

範本內容請填入以下格式範例：

```
[begin]
[question] [question]
[answer]
[agency]
[category]
[publish_date]
[end]
請將範本內容填滿。
```

In this example, I have an AI Assistant called "Tainan 1999," and I have added "Tainan 1999 FAQ" to the Knowledge Base.

The FAQ fields include Question, Answer, Agency, Category, and Publish Date.

It is recommended to upload tabular files such as **Excel, CSV, json, or jsonl**, and the fields must have **headers and corresponding content**.

	A	B	C	D	E
1	問題	答案	機關	分類	發布時間
2					
3					
4					
5					
6					
7					
8					
9					
10					
11					
12					
13					
14					
15					
16					
17					
18					

Now return to editing the response template, and click **Initialize Response Template** in the upper right corner. You will see that the system has generated response examples based on the documents you just uploaded to the Knowledge Base.

回應範本
請將範本內容填滿後，再按「儲存範本」。

範本內容請填入以下格式範例：

```
[begin]
[question] [question]
[answer]
[agency]
[category]
[publish_date]
[end]
請將範本內容填滿。
```

Initialize Response Template

Now you can edit and format the response text.

The

[] {} portions are system instructions, so you only need to handle the text portions.

📌 **Loop: Enter the corresponding document filename (specify which document to use for response generation)**

I modified the following parts:

[x] "Opening statement" content

[x] "Question" content

[x] "Category" content

[x] Removed "Agency"

[x] Closing statement content

[x] Line break formatting

感謝市民提出的問題，根據我的查詢，您的問題與下方資料相關

1.
您詢問的問題: 什麼是農地重劃？
答案: 農地重劃係指將一定區域內不合經濟利用的農地加以重新整理，予以交換分合，劃分整理成一定標準區塊，並同時配合興修水利，改良灌溉排水，配置農水路，使每一區塊農地均能直接臨路、直接灌溉及直接排水，以改善生產環境，達到增進農地利用的一種土地改良方式。

社宅的租期限制

2025/04/23 12:32:19

台南市政 1999

已使用知識庫

感謝市民提出的問題，根據我的查詢，您的問題與下方資料相關

1.
您詢問的問題: 社宅的租期限制？
答案: 租賃契約之期限最長為三年，承租人於租賃期限屆滿時仍符合承租資格者，得申請續租，租賃及續租期限合計最長不得超過六年。但符合住宅法第四條規定者，租賃期限得延長為十二年。

3. Fill in the Unable to Reply Template

If the AI Assistant determines there is no relevant data, it will respond based on the **Unable to Reply Template**.

Finally, click the **Save** button to complete.

Response Mode: Hybrid

Applicable Scenarios

Combines general responses with templates, using template format for some content while freely answering the rest. Suitable for scenarios requiring partially structured responses.

Operation Suggestions

The System Prompt content may conflict with "Response Mode: Template" at this point, so when selecting "Response Mode: Hybrid," it is recommended to write the System Prompt content with general principles and guidelines.

For example, the task of the System Prompt, interaction principles, communication attitude, etc.

Response Mode: Workflow

Applicable Scenarios

Suitable for specific task-oriented scenarios, such as knowledge management, data summarization, and brainstorming.

Operation Steps

Go to the "Response Mode Settings" tab and select "Workflow" as the response mode.\ This mode is suitable for task-oriented application scenarios, such as:

- Knowledge Management:** Assist in compiling, retrieving, or maintaining internal knowledge data
- Information Summarization:** Quickly organize document highlights or meeting notes
- Planning and Writing:** Assist in brainstorming ideas, drafting proposals, etc.

Select the corresponding workflow module based on your actual business needs to maximize the effectiveness of your AI Assistant for specific tasks.

Use Case: Copywriting Assistant

Suppose you are a marketing professional at a food company, writing promotional copy for a newly launched healthy snack.

First, select "Writing Assistant" under "Workflow."

Next, go to the AI Assistant Q&A interface and submit your writing request. The AI Assistant will guide you through filling in the key information needed for the copy, such as:

Copy topic

Writing style

Target audience

Word count

The AI will generate copy options that match your scenario and communication needs based on your settings, helping you brainstorm quickly and improve writing efficiency.

擬定一份宣傳健康零食的廣告文案

2025/04/23 12:57:36

✎ 寫作助理測試

謝謝你的回覆：我們可以開始進一步了解你的偏好，以便更好地擬定這份宣傳健康零食的廣告文案。
首先，請問你希望這篇廣告文案的主題是什麼？例如，是否想強調健康、口感、或是其他特點？

2025/04/23 12:57:42

主題強調健康兼具美味
風格幽默有趣
字數不超過兩百字

2025/04/23 12:58:40

✎ 寫作助理測試

謝謝你的回覆：我們已經了解了你對於廣告文案的主題、風格和字數的偏好。接下來，我們想進一步了解你的其他偏好。
請問你希望這篇廣告文案使用哪種語言？例如，中文、英文或其他語言？此外，你對於目標受眾有什麼特定的想法嗎？例如，年齡層或性別？

2025/04/23 12:58:51

中文，受眾為青壯年人

2025/04/23 12:59:29

✎ 寫作助理測試

謝謝你的回覆：我們已經了解了你對於語言和目標受眾的偏好。接下來，我們想進一步了解你的其他偏好。
請問你對於這篇廣告文案的數據準確性有什麼要求嗎？例如，是否需要引用具體的數據或研究結果來支持文案中的主張？此外，你對於文章的長度有沒有特別的要求？例如，是否希望有特定的字數範圍？
隨時可以結束偏好調查。

2025/04/23 12:59:38

結束偏好調查 開始寫作

獨特賣點：我們的產品如何改變你的飲食

想要改變飲食，卻又不想成為那個在派對上默默啃生菜的“健康怪人”？別擔心，我們的產品就像是你飲食中的超級英雄，讓你在享受美味的同時，還能輕鬆保持健康！想像一下，當你咬下那口香脆的健康零食，瞬間感受到的不是罪惡感，而是滿滿的幸福感，彷彿在嘴裡開了一場派對！

我們的產品不僅僅是食物，它們是你生活中的小助手。幫助你在忙碌的日常中，輕鬆攝取所需的營養。無論是工作間隙的小點心，還是健身後的能量補充，我們的美味選擇都能讓你在享受的同時，悄悄地為身體加分。想要擺脫那些無聊的飲食選擇？我們的產品就像是你的飲食魔法師，讓每一口都充滿驚喜！

所以，別再猶豫了，讓我們的產品成為你飲食的秘密武器，讓健康與美味攜手共舞，讓你在每一餐中都能感受到生活的樂趣！

產品介紹：健康又美味的選擇

在這個快節奏的生活中，健康與美味似乎總是難以兼得，但現在，這一切都將改變！想像一下，當你咬下那一口香脆的零食，卻不必擔心卡路里的負擔，這就是我們最新推出的健康美味產品的魅力所在！

這款產品不僅選用天然食材，還經過精心調配，讓每一口都充滿驚喜。無論是香濃的堅果、清新的水果，還是富含纖維的穀物，這些成分不僅能滿足你的味蕾，還能為你的身體提供所需的營養。想要在工作間隙來一點小點心？這款產品絕對是你的最佳選擇，讓你在享受美味的同時，還能保持活力滿滿！

而且，這款產品的包裝設計時尚又便攜，無論是在辦公室、健身房，還是戶外野餐，都能輕鬆攜帶，隨時隨地享受健康美味。別再猶豫了，讓我們一起告別那些無趣的零食，迎接這款健康又美味的選擇，讓生活更加多姿多彩！

用戶評價：真實的改變

在這個快節奏的生活中，健康與美味似乎總是難以兼得，但現在，這一切都將改變！想像一下，當你品嚐到一口香濃的健康零食，嘴裡的美味讓你忍不住想要再來一口，而心裡卻知道這是對身體的最佳選擇。這就是我們的秘密武器——全新推出的健康美味零食，讓你在享受美味的同時，還能輕鬆保持健康！

這款零食不僅低糖、低卡，還富含纖維和天然成分，讓你在享受美味的同時，無需擔心卡路里的負擔。想要在工作時提神？想要在運動後補充能量？這款零食都能滿足你的需求！而且，獨特的口味組合，讓每一口都像是在舌尖上跳舞，讓你忍不住想要分享給朋友。

許多用戶已經開始體驗這款零食帶來的真實改變，從體重管理到提升能量，無不讚不絕口。現在就加入這場健康美味的革命，讓你的生活從此不再平凡！

結尾：行動起來，享受健康美味

想要在健身房裡成為超級英雄，卻又不想放棄美食的快樂？別擔心，健康飲食不再是你心中的「禁忌之食」！想像一下，當你咬下那一口香脆健康的健康零食，瞬間感受到的不是罪惡感，而是滿滿的幸福感，彷彿在嘴裡開了一場派對！

Response Mode: Agent

Applicable Scenarios

In daily business operations, employees frequently need to compile data, perform data analysis, and create reports and analytical summaries in response to routine business needs or tasks assigned by managers. Common query questions include:

"Which product had the highest sales last month?"
"List all customers with sales exceeding 100,000"
"What is the revenue trend over the past three months?"

If non-technical personnel handle these questions, they often need to rely on data teams to write SQL queries, making the process time-consuming and inefficient.

Now, through MaiAgent's Agent mode, the system can use the Text to SQL tool to automatically convert natural language questions into corresponding SQL syntax and query the database in real time, quickly delivering analysis results.

For Text to SQL feature details, see: [Text to SQL Feature](#)

This feature is particularly suitable for scenarios requiring **real-time queries and data insights**, such as report analysis, operational metric tracking, and data queries. It enables non-technical users to easily access data and achieve a more intuitive and efficient data-driven decision-making process.

Text to SQL Operation Steps

Go to the "Response Mode Settings" tab and select **"Agent"** as the response mode

Upload database content or select a database URL

```
{% hint style="info" %  
}
```

MaiAgent supports:

MySQL

PostgreSQL

Oracle DB

Microsoft SQL Server (MSSQL)

The maiagent option applies Excel files you have already uploaded to the MaiAgent Knowledge Base
{% endhint %
}

Use Case: E-commerce Product Sales Data Query

Suppose you are a marketing professional at an e-commerce platform and want to quickly query product sales data.

First, select **"Agent"** as the response mode in the "Response Mode Settings" tab.

Next, you can upload an Excel file to the Knowledge Base, and the system will automatically convert it into a queryable database format.

For detailed instructions on using MaiAgent Knowledge Base for Text to SQL, see: [Using MaiAgent Knowledge Base for Text to SQL](#)

---	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	------	-----

官網銷售額最高的三個品項是什麼，排除運費

2025/04/23 14:58:43

電商營業額分析助手

根據查詢結果，官網銷售額最高的三個品項（排除運費）依序為：

1. 6201可可咖9：總銷售額為15,746元
2. 5107經典黑9：總銷售額為9,834元
3. 5208巧克力5.5：總銷售額為9,376元

這三項產品在官網的銷售表現最為突出，其中6201可可咖9的銷售額明顯領先其他品項。

6. Pre-assign Assistant Permissions

RBAC-Based Permission Management Architecture and Description

Select the **Permission Settings** tab to configure which members the assistant should be pre-assigned to for access. By default, all roles are selected. You can modify the settings based on your use case.

7. Complete Your AI Assistant Setup

After completing the above steps, click the blue **Confirm** button at the bottom right of the dialog to finish the setup.

Role Prompt Design Guide

You can use the [System Prompt Generator AI tool](#) created by MaiAgent to help you refine your system prompt

What Is a "System Prompt"?

Imagine you're directing a movie and need to tell the actors what role they're playing, what personality they have, and how they should speak. A **system prompt** is like a "script" for the AI, telling it what kind of customer service agent to portray.

Glossary of Technical Terms

Before we begin, let's get familiar with a few important concepts:

AI Agent

Analogy: Like a virtual employee you've hired

Explanation: An AI system capable of autonomously executing tasks; in customer service scenarios, it's your digital customer service representative

Prompt

Analogy: An "instruction manual" for the AI

Explanation: The instructional text that tells the AI what to do and how to do it

Context

Analogy: The "memory" and "background information" of a conversation

Explanation: The relevant information the AI needs to understand the current conversation scenario

Token

Analogy: A "unit" through which AI processes text, like breaking sentences into small chunks

Explanation: The basic unit of text processing for AI, affecting processing efficiency and cost

Why Is the System Prompt So Important?

AI Customer Service Without a System Prompt

User: "Why hasn't my order arrived yet?"

AI: "According to system data, your order status is processing."

Feels like talking to a robot — cold and impersonal

AI Customer Service With a Good System Prompt

User: "Why hasn't my order arrived yet?"

AI: "I completely understand your concern! Let me check your order status right away.

Based on the tracking information, your package is currently at the distribution center,

and it's expected to arrive tomorrow afternoon. Would you like me to provide the tracking number?"

Feels like talking to a real customer service agent — warm and professional

The Four Pillars of a System Prompt

AI Role Instruction Framework

1. Identity Definition (Who)

Tell the AI "who you are"

Bad — Vague identity

You are a customer service agent

Good — Clear identity

You are "Mei," a senior customer service specialist at MaiAgent Company, with 5 years of customer service experience, specializing in product consultation and problem resolution.

2. Tone and Style (How)

Tell the AI "how to speak"

Tone Selection Guide:

Professional and formal: Suitable for finance, legal, and healthcare industries

Friendly and approachable: Suitable for retail, dining, and lifestyle services

Lively and youthful: Suitable for gaming, entertainment, and fashion industries

Warm and caring: Suitable for education, health, and social services

Example: Friendly and Approachable Style

When responding, use a warm and friendly tone, use polite forms of address to show respect, include phrases like "happy to help" for a personal touch, but avoid being overly enthusiastic or using too many exclamation marks.

3. Professional Capabilities (What)

Tell the AI "what you can do"

Your professional capabilities include:

- Product feature introductions and usage guidance
- Order inquiries and logistics tracking
- Return and exchange policy explanations
- Initial technical problem diagnosis
- Account and payment issue resolution

When encountering issues beyond your capabilities, proactively transfer the customer to a human agent.

4. Behavioral Guidelines (Rules)

Tell the AI "what you can and cannot do"

Mandatory principles:

- Protect user privacy and never disclose personal information
- Admit when you don't know something and never fabricate answers
- When handling complaints, stay calm – apologize first, then resolve
- Keep responses under 100 words for conciseness

Strictly prohibited:

- Making promises that cannot be fulfilled
- Arguing with or contradicting users
- Disclosing internal company information
- Processing refund requests beyond your authority

Hands-On: Design Your First System Prompt

Step 1: Analyze Your Business Needs

Consider these questions:

Who are your customers? (age, occupation, usage habits)

What are your product/service highlights?

What questions do customers ask most frequently?

What kind of service experience do you want to deliver?

Step 2: Choose the Right Role Configuration

E-commerce Customer Service Example

```
You are "Helper," a professional online shopping consultant.  
You are familiar with all product information, skilled at recommending suitable  
products,  
and can quickly handle order-related issues.  
Your speaking style is friendly and natural, caring about customer needs like a  
friend.
```

Healthcare Customer Service Example

```
You are "Health Helper," a professional healthcare service consultant.  
You have basic medical knowledge and can provide information about appointments,  
examination procedures, etc.,  
but you never provide medical diagnosis advice.  
Your speaking style is professional and warm, making patients feel reassured.
```

Step 3: Write the Complete System Prompt

System Prompt Template

```
# Role Identity
You are [Role Name], [Job Title] at [Company Name].
[Role background and professional experience]

# Service Objective
Your primary task is [core task],
helping customers [achieve goal] through [service approach].

# Language Style
- Tone: [Choose appropriate tone]
- Vocabulary: [Specific vocabulary requirements]
- Length: [Response length limit]

# Professional Capabilities
You can handle the following issues:
- [Capability 1]
- [Capability 2]
- [Capability 3]

# Behavioral Guidelines
Must follow:
- [Guideline 1]
- [Guideline 2]

Strictly prohibited:
- [Prohibited action 1]
- [Prohibited action 2]

# Special Situation Handling
When encountering [special situation], please [handling approach].
```

Advanced Tips: Make Your System Prompt More Vivid

1. Add Personality Traits

Basic version:

```
You are a customer service agent responsible for answering questions.
```

Vivid version:

You are "Zhi," a curious tech enthusiast.
You're always excited about new features and love using simple analogies to explain complex technical concepts, making them easy for everyone to understand.

2. Context-Aware Instructions

Adjust responses based on different scenarios:

```
# Context-Aware Instructions
- When a customer expresses dissatisfaction: respond with empathy first, then provide a solution
- When a customer asks a technical question: explain using everyday analogies
- When a customer hesitates to purchase: provide objective advice without pressuring a sale
- When a customer praises the product: express gratitude and ask if they need further assistance
```

3. Dynamic Adjustment Mechanism

```
# Conversational Adaptability
Adjust your style based on the customer's responses:
- If the customer uses formal language, be correspondingly formal
- If the customer seems impatient, be more concise and efficient
- If the customer is chatty, you can slightly extend the topic
```

4. Version Control Friendly

Add version numbers and changelogs

Maintain backward compatibility, ensuring existing workflows still function correctly after updating the system prompt

Example:

```
Version: v1.0
# Update date: October 26, 2024
# Changelog:
#   - Initial version, providing basic product recommendation functionality.
#   - Recommends products based on user preferences.
#   - Response tone set to friendly and professional.
```

Test and Optimize Your System Prompt

Phase 1: Basic Testing

Test whether the AI's responses meet expectations using common questions

Test Question Examples:

"What is your return policy?"

"When will my order arrive?"

"Is this product right for me?"

Phase 2: Boundary Testing

Test the AI's performance in extreme situations

Boundary Scenario Examples:

When a customer is emotionally agitated

When encountering a question with no known answer

When asked to do something beyond authority

Phase 3: Continuous Optimization

Collect Data

Customer satisfaction scores

Issue resolution rate

Rate of transfers to human agents

Adjustment Strategies

Supplement the knowledge base based on common questions

Adjust language style based on customer feedback

Refine behavioral guidelines based on failure cases

System Prompt Length Control Tips****

Best Practice Guidelines

The ideal system prompt length should be kept within 500-2000 words (approximately 200-800 tokens), with the optimal range typically being 800-1500 words.

Remember this core principle: "Clarity over verbosity" — overly long instructions tend to be ignored by the model, while overly short ones may lead to unstable behavior.

Why Does Length Matter?

First, there's the **model performance** consideration — an overly long prompt dilutes the model's attention, affecting the execution of key instructions. Second, there's the **context space** limitation — the system prompt occupies the conversation's context window, compressing the space available for user conversation. Finally, there's **maintenance cost** — a concise, structured prompt is easier to continuously optimize and adjust.

Three Writing Tips

Structured design: Clearly segment content and place core instructions at the beginning.

Conciseness principle: Remove duplicate descriptions and lengthy background, keeping only essential rules.

Continuous validation: Conduct A/B testing across different models (GPT, Claude, Gemini) to find the optimal length configuration.

Practical Considerations

Different AI models have varying tolerance for long prompts, requiring individual testing and validation. For token calculation, Chinese characters are approximately 1 token each, while English is approximately 1 token per 0.75 words. Since the system prompt carries higher instruction weight, keep the content focused and avoid unnecessary verbosity.

Frequently Asked Questions and Solutions

Q1: How can I make the AI's responses more natural?

A: Add specific conversation examples in the system prompt and set clear language style guidelines.

Q2: What if the AI keeps answering irrelevant questions?

A: Clearly define the service scope in the system prompt and teach the AI how to identify and handle out-of-scope questions.

Q3: How do I balance professionalism and approachability?

A: Adjust based on your target audience. B2B customers prefer professionalism, while B2C customers prefer approachability. Design A/B tests to find the optimal balance.

Conclusion: Build Your Custom AI Customer Service

Designing a system prompt is like training a new employee — it requires patience and continuous adjustment. Remember these key principles:

Clear positioning: Clearly tell the AI who it is

Consistent style: Maintain a unified language style

Clear boundaries: Clearly define what can and cannot be done

Continuous optimization: Continuously improve based on actual usage

Start designing your first system prompt now! Remember, the best system prompts are those that are continuously refined through actual use.

Add a Role Prompt to an AI Assistant

Once you have written your system instructions, add them in the MaiAgent AI agent settings:

Add System Instructions

1. Open the AI agent settings

In the left menu, select **AI Features** > **AI Agents**. Find the AI agent you want to configure, then click the **Edit** icon in its **Actions** column.

Click the Edit icon in the Actions column to open the AI agent settings

2. Switch to the answer mode settings

Under the **Settings** tab, select **Answer Mode Settings** from the menu on the left.

Set **Answer Mode** to **RAG Q&A** or **Agent Mode**, or expand **Other Modes** and select **Hybrid**:

System instructions are unavailable in **Template** mode (under **Other Modes**).

Select an answer mode in Answer Mode Settings

3. Enter text in the system instructions section

On the same page, enter your instructions in the **System Instructions** section below. Then click **Save** in the bottom right.

Enter text in the System Instructions section

Your AI agent will now act according to the system instructions you defined.

Multi-Language Support

MaiAgent provides multi-tiered language support: **Web Chat supports 13 interface languages**, the **knowledge base supports content processing in all languages**, and the **admin dashboard offers Chinese and English interfaces**. This enables your AI assistant to engage in natural, fluent conversations with users worldwide, breaking language barriers and expanding your business reach.

Supported Languages

MaiAgent Web Chat currently supports the following 13 languages:

Chinese

Traditional Chinese (Traditional Chinese) - zh-TW

Simplified Chinese (Simplified Chinese) - zh-CN

International Common Languages

English (English) - en

Southeast Asian Languages

Thai (Thai) - th

Malay (Malay) - ms

Vietnamese (Vietnamese) - vi

Indonesian (Indonesian) - id

Filipino (Filipino) - fil

Burmese (Burmese) - my

Khmer (Khmer) - km

Lao (Lao) - lo

East Asian Languages

Japanese (Japanese) - ja

Korean (Korean) - ko

Continuous Updates: We continue to add more language support based on user demand. If you need support for a specific language, please contact our technical team.

 Language Configuration Methods

1. Configure via JavaScript

Refer to [Technical Manual — Web Chat](#)

2. Web Chat Settings

Configuration Steps:

Click  in the top right corner of the window

2. Click Traditional Chinese

3. Select your preferred language

🌐 Multi-Language Feature Highlights

1. Intelligent Language Detection & Response

Auto-Detection (Chinese & English): Supports automatic detection of Chinese and English; the system responds in the corresponding language.

Multi-Language Configuration: Supports multiple language systems; you can switch and select the display language in settings. Once selected, conversations respond in the chosen language.

High Accuracy: Based on advanced NLP technology, language detection accuracy reaches 98%.

2. Natural Language Understanding

Semantic Understanding: Not just translation, but genuine understanding of semantics across different languages

Cultural Adaptation: Considers expression habits across different cultural backgrounds

Slang Recognition: Understands common slang and colloquial expressions

3. Localized Responses

Word Choice: Uses wording and expressions that match local conventions

Format Adjustment: Adjusts date, number, and currency formats based on different languages

📖 Knowledge Base & Interface Language Guide

I. Interface Language Support Levels

MaiAgent Admin Dashboard

Supports 3 interface languages: Traditional Chinese, Simplified Chinese, English

Applicable for system management and configuration operations

Web Chat Interface

Supports all 13 languages for interface display

Includes voice recognition and voice response features

Covers: Chinese (Traditional & Simplified), English, Thai, Japanese, Korean, Malay, Vietnamese, Indonesian, Filipino, Burmese, Khmer, Lao

II. Knowledge Base Content Processing Capabilities

Full-Language Document Support

The knowledge base can parse and process document content in any language

No document language restrictions — supports all global language formats

Intelligent retrieval can accurately search across multi-language knowledge bases

Upload Steps:

1. Go to Knowledge Base Management
2. Select Add Document
3. Upload documents in any language (no language restrictions)
4. The system automatically detects the document language and builds multi-language indexes

III. Cross-Language Q&A Capabilities

Core Features

Multi-Language Queries: Support free-form questions in 13 languages

Full-Language Retrieval: Search for relevant content across the complete multi-language knowledge base

Intelligent Translation: Automatically translate retrieval results into the user's preferred language

Accurate Responses: Ensure completeness and accuracy of answers

Workflow

Receive Query - User asks a question in any supported language (Thai, Japanese, Korean, etc.)

Intelligent Retrieval - System searches across languages for the most relevant content

Content Integration - LLM analyzes and integrates multi-language data

Language Conversion - Translates into the user's selected display language

Output Answer - Provides a complete response

🚀 Use Cases

1. Southeast Asian Market Expansion

Regional Coverage: Supports 8 major Southeast Asian languages, covering over 600 million people

Localized Service: Understands cultural differences and business customs across countries

Cross-Border E-Commerce: Provides native-language shopping experiences for customers in different countries

2. International Customer Service Center

Global Support: Covers customer service needs across major Asian markets

24/7 Service: Multi-language customer support across time zones

Cultural Sensitivity: Understands communication styles and politeness norms across different cultures

3. Multinational Enterprise Internal

Employee Support: Provides internal Q&A services for multinational staff

Knowledge Sharing: Breaks language barriers to promote knowledge flow

Training Assistance: Multi-language training content and Q&A

4. Travel & Tourism Industry

Tourist Services: Provides real-time assistance for tourists from different countries

Attraction Information: Multi-language attraction information and guided tour services

Booking Services: Supports multi-language reservation and inquiry services

AI Customer Service Quality Management

Target Audience: Customer service managers, quality management personnel, customer service trainers

1. Quick Start: Three Quality Metrics for AI Customer Service

How to View Evaluation Report Scores

Path: AgentOps (sidebar) → **AI Assistant Monitoring** → **Conversation Records** tab

The **Quality Score** column in the table uses the faithfulness score as its primary score. Hover over the score to view the individual metrics in **Quality Score Details**, including faithfulness, answer relevancy, and context precision. Click the **Details** icon in the Actions column to open the conversation details.

Quality Score column and Details button in AI Assistant Monitoring → Conversation Records

Quality scores are generated only after automatic evaluation is enabled for an AI assistant. Go to **AI Assistant** → select an assistant → **Settings** → **Advanced Settings**, turn on **Enable Automatic Evaluation**, and save. Once enabled, the system uses an LLM to calculate a quality score for each conversation, consuming your organization's usage quota. When disabled, the Quality Score column displays “-” .

Enable automatic evaluation in the AI assistant's Advanced Settings

Why Is Evaluation Needed?

Just like reviewing call recordings of customer service agents, we also need to check the quality of AI responses.\

The system automatically scores each conversation, helping you quickly identify issues.

Three Core Metrics

Metric	Plain Language Explanation	Scoring Criteria
Faithfulness Score	Is the information provided by the AI correct? Does it make things up or hallucinate?	85+ 60-84 Below 60
Answer Relevancy Score	Did the AI answer the customer's actual question?	85+ 60-84 Below 60
Context Precision Score	Did the AI find the correct reference materials and respond precisely to the context?	85+ 60-84 Below 60

Quick Assessment Method

All three metrics > 80

→

This response is good

Any metric < 60

→

Immediate improvement needed

Two or more < 70

→

Systemic issue, comprehensive review needed

2. How to Read Evaluation Reports

Report Example

Conversation ID: #20240120-001

Customer Question: "Do you still have the black trench coat in XL?"

AI Response: "The black trench coat is currently in stock. XL is available for order."

Evaluation Results:

└─ Faithfulness Score (faithfulness_score): 45 ❌ (Said it was in stock, but it actually wasn't)

└─ Answer Relevancy Score (answer_relevancy_score): 90 ✅ (Did answer the stock question)

└─ Context Precision Score (context_precision_score): 70 ⚠️ (Found trench coat data, but size information was not precise enough)

Diagnosis: AI provided incorrect inventory information

Three Common Issue Types

Issue A: Low Faithfulness Score (< 60)

Symptoms: The information from the AI is incorrect or fabricated

Common Causes:

Reference data is outdated (prices, inventory, policies have been updated)

Contradictory data (different documents say different things)

AI "guesses" the answer instead of relying on database content

Impact: Customers may receive incorrect information, leading to complaints

Issue B: Low Answer Relevancy Score (< 60)

Symptoms: The AI did not answer what the customer actually asked

Common Causes:

AI provided a lot of information but missed the key point

Off-topic response with irrelevant content

Only provided background without giving an actual answer

Impact: Customers need to ask again, reducing satisfaction

Issue C: Low Context Precision Score (< 60)

Symptoms: The AI referenced the wrong materials or was not precise enough

Common Causes:

Inaccurate keyword search

Confused data from different products/categories

Unclear titles or categories in the reference materials

Impact: Even if the AI intends to answer well, using the wrong data leads to wrong answers

3. Real-World Cases: Common Issues in the Apparel Industry

Case 1: Wrong Price (Low Faithfulness Score)

Problem Identified

Customer Question: "How much is this down jacket?"

AI Response: "This down jacket is priced at NT\$ 3,990."

Evaluation Results:

Faithfulness Score (faithfulness_score): **38** ❌

Answer Relevancy Score (answer_relevancy_score): 95 ✅

Context Precision Score (context_precision_score): 85 ✅

Actual Situation:\

The product had been repriced to NT\$ 2,990 (after discount), but the AI still quoted the original price.

Improvement Plan

Step 1: Check the Data

Open the "Product Price List" in the Knowledge Base

Found that the price had not been updated

Step 2: Update the Data

❌ Problematic Data

Down Jacket Series

- Classic Down Jacket: NT\$ 3,990
- Long Down Jacket: NT\$ 4,990

✅ Corrected Data

Down Jacket Series (2024 Winter Prices)

Product Name: Classic Down Jacket

- Original Price: NT\$ 3,990
- Discounted Price: NT\$ 2,990 (effective 2024/1/1)
- Promotion Period: 2024/1/1 - 2024/2/28

Product Name: Long Down Jacket

- Original Price: NT\$ 4,990
- Discounted Price: NT\$ 3,990 (effective 2024/1/1)
- Promotion Period: 2024/1/1 - 2024/2/28

Last Updated: 2024/1/15

Step 3: Instruct the AI

Add the following to "AI Response Guidelines":

"When answering price questions, always confirm that the price is the latest one and state the applicable period. If there is a promotional discount, provide both the original price and the discounted price."

Case 2: Off-Topic Response (Low Answer Relevancy Score)

Problem Identified

Customer Question: "I bought something that doesn't fit. Can I return it?"

AI Response: "We offer a variety of sizes, including S, M, L, and XL. Each garment has a size chart on the product page. We recommend checking the size chart before purchasing."

Evaluation Results:

Faithfulness Score (faithfulness_score): 90 

Answer Relevancy Score (answer_relevancy_score): 35 

Context Precision Score (context_precision_score): 60 

Diagnosis:\

The customer asked "Can I return it?" but the AI talked about "How to choose a size," completely missing the core question.

Improvement Plan

Step 1: Adjust Response Guidelines

Add the following to "AI Response Guidelines":

Core Principle: Answer the customer's core question first

Bad example:

Customer asks "Can I return it?"

AI answers "We have comprehensive after-sales service..." ❌ (Didn't say yes or no)

Good example:

Customer asks "Can I return it?"

AI answers "Yes. Within 7 days of delivery, if the item is unused, you can apply for a return..." ✅ (Direct answer)

Step 2: Restructure the Data

❌ Problematic Data (too unfocused)

After-Sales Service Description

Our company values customer rights and provides comprehensive after-sales service.

Please review the size chart carefully when purchasing to choose the right size.
If you have any questions, feel free to contact customer service...

✅ Corrected Data

Return and Exchange Policy

Q: Can I return an item?

A: Yes. Within 7 days of delivery, if the item is unused and tags are intact, you can apply for a return.

Return Conditions:

- ✓ Item is unused, unwashed, and not tried on for more than 10 minutes
- ✓ Tags and packaging are intact
- ✓ Return request submitted within 7 days of delivery
- ✗ Sale items and undergarments are non-returnable

Return Process:

1. Call customer service at 0800-XXX-XXX or fill out the online form
2. Customer service will provide the return address and tracking number
3. Refund will be issued to the original payment method within 7-14 days

Q: Can I exchange an item?

A: Yes. Within 7 days of delivery, you can exchange for a different size or color (same product only) at no charge.

Exchange Process:

1. Contact customer service to confirm stock availability
2. Ship the item back (same conditions as returns)
3. New item will be shipped within 3 days of receiving the returned item

Key Improvements:

- ✓ Starts with a direct "Yes" or "No" answer
- ✓ Uses Q&A format for clarity at a glance
- ✓ Lists clear conditions to avoid disputes

Case 3: Wrong Product Referenced (Low Context Precision Score)

Problem Identified

Customer Question: "What material is the black knit top made of?"

AI Response: "This knit top is made of 100% pure cotton, soft and comfortable, suitable for all seasons."

Evaluation Results:

Faithfulness Score (faithfulness_score): 88 ✓

Answer Relevancy Score (answer_relevancy_score): 90 ✓

Context Precision Score (context_precision_score): 48 ✗

Actual Situation:

The black knit top is 70% wool + 30% polyester. The AI referenced the "white knit top" data (100% pure cotton) instead.

****Improvement Plan******Step 1: Check Data Labels**

Problematic file name:

```
knit-top.pdf
```

Issue: All knit tops are in the same document, making it difficult for the AI to distinguish between them.

Step 2: Improve Data Structure**✓ Solution A: Separate Files**

```
Product Data/  
├─ knit-top_black_model-A001.pdf  
├─ knit-top_white_model-A002.pdf  
└─ knit-top_gray_model-A003.pdf
```

✓ Solution B: Clear Headings

Knit Top Product Information

Black Knit Top (Model: A001)

- Color: Black
- Material: 70% Wool + 30% Polyester
- Suitable Season: Fall/Winter
- Care Instructions: Hand wash, do not tumble dry

White Knit Top (Model: A002)

- Color: White
- Material: 100% Pure Cotton
- Suitable Season: All seasons
- Care Instructions: Machine washable, tumble dry on low

Gray Knit Top (Model: A003)

- Color: Gray
- Material: 50% Wool + 50% Acrylic
- Suitable Season: Fall/Winter
- Care Instructions: Dry clean only

Step 3: Instruct the AI

Add the following to "AI Response Guidelines":

"When a customer mentions a product's color or model number, always verify that the reference data corresponds to the correct color and model. Different colors of the same product may have different materials and specifications."

4. Three-Step Improvement Plan

When you identify issues, follow this process:

```
Low score detected
  ↓
Step 1: Update data content (most important)
  ↓
Step 2: Adjust AI response guidelines
  ↓
Step 3: Escalate to the technical team (if necessary)
```

Step 1: Update Data Content

When to use:

- ✅ Low Faithfulness Score (data is incorrect or outdated)

✓ Low Context Precision Score (data is disorganized or poorly labeled)

Checklist:

- ☐ Is the data up to date?
- ☐ Are prices, inventory, and policies correct?
- ☐ Is data for different products clearly separated?
- ☐ Are headings clear? (So the AI can find them easily)
- ☐ Is the content presented in bullet points or tables? (Rather than large blocks of text)

Data Quality Examples:

✗ Poor Data

Return Policy

Some products can be returned, but certain conditions must be met.
Some special products cannot be returned. Please check before purchasing.
Contact customer service if you need to return an item.

✓ Good Data

Return Policy

Returnable Products:

- ✓ General apparel (tops, pants, outerwear)
- ✓ Accessories (bags, hats, scarves)

Non-Returnable Products:

- ✗ Undergarments, swimwear
- ✗ Sale items (50% off or more)
- ✗ Customized items

Return Conditions (all must be met):

1. Within 7 days of delivery
2. Item is unused (tags intact, no signs of wear)
3. Packaging is intact

Return Process:

1. Call customer service at 0800-XXX-XXX
2. Provide your order number
3. Customer service will provide the return address
4. Ship the item back (registered mail recommended)
5. Refund issued within 7-14 days of receiving the item

Contact Information:

- Customer Service Hotline: 0800-XXX-XXX (09:00-21:00)
- Online Chat: Bottom right corner of the website
- Email: service@example.com

Step 2: Adjust AI Response Guidelines

In this guide, “AI Response Guidelines” correspond to the AI assistant's **Role Instructions** (**AI Assistant** → select an assistant → **Settings** → **Response Mode Settings** → **Role Instructions**).

When to use:

- ✓ Low Answer Relevancy Score (off-topic responses)
- ✓ Low Faithfulness Score (AI guessing or hallucinating)

AI Response Guidelines Template:

AI Customer Service Response Guidelines

Core Rules

1. Answer the core question first
 - Customer asks "Can I/Is it possible" → Answer "Yes" or "No" first
 - Customer asks "How much" → State the price first
 - Customer asks "How to" → Provide the steps first
2. Only state what you are certain about
 - All information must come from reference materials
 - If unsure, say "This requires assistance from a human agent"
 - Never guess or assume
3. Pay attention to details
 - Do not confuse colors, sizes, or model numbers
 - Verify prices are current
 - Clearly state promotion periods

Response Format

Policy Questions (returns, membership, promotions)

Paragraph 1: Directly answer "Yes" or "No"

Paragraph 2: State the conditions (in bullet points)

Paragraph 3: Tell the customer what to do (process or contact info)

Product Questions (price, material, stock)

Paragraph 1: Directly answer the question (price/material/availability)

Paragraph 2: Supplementary product info (specs, sizes, colors)

Paragraph 3: Purchase link or next steps

Process Questions (how to buy, return, exchange)

Paragraph 1: Summarize the process (3-5 steps)

Paragraph 2: Explain each step in detail

Paragraph 3: Notes or contact information

Prohibited Behaviors

- ✗ Do not say "usually," "generally," or "approximately" (be specific)
- ✗ Do not confuse information from different products
- ✗ Do not omit important details (price, size, deadline)
- ✗ Do not speculate about information the customer hasn't provided

Examples

✓ Good Response:

Customer: "Can I return this jacket?"

AI: "Yes. Within 7 days of delivery, you can apply for a return if the following conditions are met:

- Item is unused, tags are intact
- Packaging is undamaged
- Not a sale item

Return process: Please call customer service at 0800-XXX-XXX, and we will provide the return address and instructions. Refunds are processed within 7-14 business days to the original payment method."

✗ Bad Response:

Customer: "Can I return this jacket?"

AI: "Our company values customer rights and provides comprehensive after-sales service. We recommend reviewing the product description carefully and choosing the right size before purchasing. If you have any questions, feel free to contact customer service..." (Did not directly answer whether a return is possible)

Step 3: Escalate to the Technical Team

When to use:

Context Precision Score is consistently low

The same issue occurs repeatedly

No improvement after adjusting data and guidelines

Escalation Content:

Issue Type: Low Context Precision Score

Issue Description:

When customers ask about "black" products, the AI frequently retrieves data for "white" or other colors.

Scope of Impact:

Approximately 15% of product-related queries are affected

Attempted Improvements:

- ✓ Separated product data by color into individual files
- ✓ Explicitly labeled colors in headings
- ⚠ Issue is not fully resolved

Suggested Technical Adjustment:

Request the system to more accurately recognize "color" keywords

Attachments:

- test_cases_color_queries.csv (100 test questions)
- current_results.csv (current system retrieval results)
- expected_results.csv (expected correct results)

5. Daily Management Checklist

Daily Checks

When issues are found:

If the same type of issue occurs ≥ 3 times
→ Handle immediately (update data or adjust guidelines)

If it involves price or policy errors
→ Urgent fix, complete within the same day

If it's an occasional issue
→ Log and observe, add to discussion agenda

Response Quality Tracking

1. Data Review

This Week's Statistics:

- Total conversations: __ sessions
- Average Faithfulness Score (faithfulness_score): __ points
- Average Answer Relevancy Score (answer_relevancy_score): __ points
- Average Context Precision Score (context_precision_score): __ points
- Anomalous conversations: __ sessions (____%)

2. Issue Analysis

Top 3 High-Frequency Issues:

1. _____ (__ occurrences) - Which metric is low?
2. _____ (__ occurrences) - Which metric is low?
3. _____ (__ occurrences) - Which metric is low?

3. Improvement Actions

This week's tasks:

- ☐ Update __ documents (Owner: __)
- ☐ Adjust __ response guidelines (Owner: __)
- ☐ Escalate __ technical issues (Owner: __)

Next week's goals:

- Reduce anomalous conversation rate to < ____%
- All metrics averaging > __ points

Appendix A: Issue Diagnosis Quick Reference

Score Status	Possible Cause	Improvement Method
Low Faithfulness Score	Outdated or incorrect data, AI hallucination	Step 1: Update data content
Low Answer Relevancy Score	AI gives off-topic responses	Step 2: Adjust response guidelines
Low Context Precision Score	AI references wrong data or lacks precision	Step 1: Improve data labeling
Multiple metrics are low	Systemic issue	Steps 1+2, Step 3 if necessary

Improvement Priority Order

First Priority: Faithfulness Score < 60

→ May give customers incorrect information or hallucinated content, leading to complaints

Second Priority: Answer Relevancy Score < 60

→ Poor customer experience, requires repeated inquiries

Third Priority: Context Precision Score < 60

→ Although the issue is less obvious, it will affect quality over time

Appendix B: System Evaluation Metrics Reference

Primary Metrics (No Ground Truth Required)

These three metrics are the core of this guide and can be directly applied to daily customer service conversation evaluations:

Name	English Full Name	Description
Faithfulness Score	Faithfulness	Evaluates whether the AI response aligns with database content, or if it hallucinates or fabricates information
Answer Relevancy Score	Answer Relevancy	Evaluates whether the AI response is relevant to the customer's question, or if it's off-topic
Context Precision Score	Context Precision	Evaluates whether the AI response precisely addresses the context and references the correct materials

Advanced Metrics (Ground Truth Required)

The following metrics require pre-prepared "ground truth" answers and are suitable for test case evaluations:

Name	English Full Name	Description
Answer Correctness	Answer Correctness	Compares AI response against the ground truth to evaluate correctness
Answer Similarity	Answer Similarity	Evaluates semantic similarity between the AI response and the ground truth
Context Recall	Context Recall	Evaluates whether the system retrieved all necessary reference materials

Other Available Metrics (DeepEval)

In the evaluation results under AgentOps → Automated Testing, the system also provides the following additional metrics for more comprehensive quality checks:

Name	English Name	Description
Bias Detection	Bias	Detects whether responses contain biased or discriminatory content
Toxicity Detection	Toxicity	Detects whether responses contain inappropriate or offensive content
Hallucination Detection	Hallucination	Detects whether the AI generates content that contradicts facts
Contextual Relevancy	Contextual Relevancy	Evaluates whether retrieved reference materials are relevant to the question

Usage Recommendations

- Daily Monitoring:** Use the three primary metrics (Faithfulness Score, Answer Relevancy Score, Context Precision Score)
- Test Evaluations:** Use advanced metrics with prepared ground truth answers for systematic evaluations
- Quality Assurance:** Enable bias and toxicity detection to ensure responses comply with corporate standards

FAQ

Q1: I'm not technical — can I still manage AI customer service?

A: Absolutely! Just like managing customer service staff, you only need to:

- Review evaluation reports daily to identify problematic conversations
- Check whether data is correct and complete
- Adjust the AI's "response guidelines" (just like training customer service scripts)

****Q2: How are the scores calculated? Does the AI grade itself?****

A: No. The scoring is performed automatically by a dedicated "evaluation system," like having another AI serve as "quality control" to check the first AI's responses.

****Q3: Are all three metrics equally important? Can I just look at one?****

A: We recommend looking at all three, as they reflect different issues:

Faithfulness Score (`faithfulness_score`): Whether the AI aligns with database content, whether it hallucinated

Answer Relevancy Score (`answer_relevancy_score`): Whether the AI understood the question and gave a relevant response

Context Precision Score (`context_precision_score`): Whether the AI precisely addressed the context and found the right reference materials

Looking at only one may cause you to miss important issues.

****Q4: How long until I see improvement after making changes?****

A:

Data updates: Take effect immediately (improvements visible the same day)

Response guideline adjustments: Take effect immediately

Technical adjustments: Require 2-4 weeks (depending on complexity)

Conclusion

Managing AI customer service is just like managing a real customer service team:

✓ **Regularly check quality** (review evaluation reports)

✓ **Continuously update knowledge** (update data content)

✓ **Optimize response scripts** (adjust response guidelines)

✓ **Track improvement results** (monitor score changes)

By following this guide, you can continuously improve your AI customer service — even without technical expertise!

Cross-Conversation Search

Cross-conversation search lets an AI assistant search recent conversations with the same contact in the same inbox when responding. It is useful when service history needs to carry over, but users frequently start new conversations.

This feature is disabled by default. Enabling it only expands the AI assistant's search scope. It does not mix content from different contacts or inboxes.

Enable Cross-Conversation Search

In the left menu, click “[AI Assistant](#).”

Select the AI assistant you want to configure and open “[Settings](#).”

Open “[Advanced Settings](#).”

Under the conversation memory settings, enable “[Cross-Conversation Search](#).”

Under “[Lookback Period \(Days\)](#),” enter a value from 1 to 365 days. The default is 90 days.

Enable cross-conversation search under Advanced Settings and configure the search range for recent conversations

Click “**Save.**”

A longer lookback period expands the searchable history. Configure it according to your service requirements and comply with your organization's data use and privacy policies.

Use Case

MaiAgent's customer service assistant tracks after-sales cases. A customer provided their order status in a conversation last week and starts a new conversation today to ask for an update. The administrator enables cross-conversation search for the customer service assistant and sets the lookback period to 30 days. After the settings are saved, the assistant can use the conversation history tool to find relevant content from the same customer's recent conversations and respond based on those records.

Scope

Cross-conversation search includes:

The same contact

The same inbox

Regular chat conversations that have not been deleted

Conversations whose latest message falls within the configured lookback period

For conversations within the lookback period, the entire message history is included, not just messages sent during that period. The system selects up to 200 of the most recently active conversations. The current conversation is always included in the search scope, regardless of the configured lookback period.

When this feature is disabled, the assistant searches only the current conversation. Cross-conversation search and “Vector Memory” are independent settings and can be enabled or disabled separately.

Knowledge Base Tag Filtering

Knowledge Base label filtering lets you configure a default set of label conditions for each AI Assistant. Once configured, the assistant references only files and FAQs that match the conditions when answering questions and ignores all other content. The same rules apply whether users ask questions through Web Chat, LINE, the API, or back-office conversations.

When label filtering is not configured, the assistant references all files in every mounted Knowledge Base, exactly as it did before.

Previously, limiting an assistant to files with specific labels required passing query metadata with every API call or configuring contacts individually. Now you only need to configure it once on the assistant settings page.

Use Case

A retail chain's Knowledge Base contains public return and exchange policies, a membership points program, and store-opening and cashier SOPs intended only for employees. The Knowledge Base administrator adds the "Public for Customer Service" label to public documents and the "Internal Operations" label to internal documents. On the customer service assistant's settings page, the administrator then enables "Label Filtering," selects "Public for Customer Service," and saves the settings. From then on, the assistant cites only public documents when customers ask questions through the website's Web Chat or LINE. Even if a customer asks about store-opening procedures, the assistant cannot find the internal SOP and will not disclose internal information. No integration code changes are required.

Prerequisites

The assistant has at least one mounted Knowledge Base (configured under "**Knowledge Base Settings**" on the assistant settings page).

Labels have been created in the Knowledge Base and applied to files or FAQs. For instructions on creating and applying labels, see [Document Management: Tags and Metadata](#).

Available labels come from the Knowledge Bases mounted by this assistant. If the assistant has multiple mounted Knowledge Bases, the same set of conditions applies to all of them.

Configure Label Filtering

In the left menu, click "**AI Assistants**," select the assistant you want to configure, and open "**Settings**."

Under "Knowledge and Data," click "**Label Filtering**." The scope appears in the upper-right corner, showing the Knowledge Bases currently mounted by this assistant.

When no conditions are configured, the assistant references all files

Under "Condition Group 1," click labels to add them to the condition. You can add multiple labels and choose "**Include All Labels**" or "**Include Any Label**" to determine how the group is evaluated.

Scroll down to the "**Affected Files**" panel to confirm which files will be retrieved and which will be excluded. The panel calculates the result in real time based on the conditions currently shown, including unsaved changes.

After a label is added, the plain-language description and Affected Files panel update in real time

Click "**Save**" in the lower-right corner. After saving, "Configured" appears next to "Label Filtering" in the left menu.

Label filtering shares the same "Save" button as the assistant's other settings. Remember to save before leaving the page, or the conditions will not take effect.

How to Read Conditions

The builder describes conditions in plain language instead of displaying AND/OR. This guide includes the corresponding logic in parentheses for comparison with the previous interface or API documentation. Conditions have two levels: "within a group" and "between groups."

Level	Option	Meaning
Within a group (between labels in the same condition group)	Include All Labels (AND)	A file must have every label listed in the group
Within a group	Include Any Label (OR)	A file only needs one of the labels in the group

Level	Option	Meaning
Between groups (between multiple condition groups)	Match Every Group (AND)	A file must satisfy every condition group
Between groups	Match Any Group (OR)	A file only needs to satisfy one condition group

For combinations such as "A or B," click "**Add Condition Group**" to add another group. The "For Multiple Groups" selector appears only when there are two or more groups.

Two condition groups: files labeled "Public for Customer Service" or files labeled "Internal Operations"

At the bottom of the builder, a sentence describes the current conditions, such as: "The assistant will only reference files labeled 'Public for Customer Service' or 'Internal Operations.'" If you are unsure whether the conditions are correct, refer to this sentence and the "Affected Files" panel.

The "Affected Files" panel counts files that have been loaded on the page. If the Knowledge Base contains many files, the panel displays "Only the first N loaded files are counted." Actual retrieval still applies the conditions to all files.

Scope and Priority

The assistant's label filtering acts as a "default" for all conversations handled through that assistant, including Web Chat, conversation platforms such as LINE, API integrations, and back-office conversations.

If query metadata has already been specified at another level for a conversation, that level takes precedence and the assistant default is not used. The priority from highest to lowest is:

Query metadata passed with an individual message (for example, in an API call or Web Chat embed)

Conversation-level query metadata

Contact query metadata

Assistant label filtering (configured on this page)

In other words, existing contact or API settings are unaffected. The assistant's default conditions apply only when none of the first three levels specifies query metadata. For configuration instructions at each level, see [Knowledge Management Permissions: Query Metadata](#) and [Getting Started with the Query Builder](#).

The Knowledge Base "Search Test" is a tool for checking retrieval quality and does not apply the assistant's label filtering.

Invalid Labels

If a label referenced by a condition has been renamed or deleted, or if its Knowledge Base has been unmounted from the assistant, reopening the settings page displays an invalid-label warning listing the affected labels. Click "[Remove Invalid Labels](#)" to remove them all at once, or select other labels and save.

Invalid labels never match any files during retrieval, and they do not broaden retrieval to include everything. If the assistant suddenly cannot answer using Knowledge Base content, first check whether label filtering contains invalid labels.

Clear Settings

Click "[Clear All Conditions](#)" in the upper-right corner of the builder and save. The assistant will return to referencing all files.

If the Knowledge Bases mounted by the assistant do not contain any labels, this page displays "The mounted Knowledge Bases do not have any labels." Add labels to files in the Knowledge Base first.

Message displayed when the Knowledge Base does not contain any labels

Custom Maximum Output Tokens

Feature Introduction

The custom max output tokens feature allows you to precisely control the maximum length of each AI assistant response. By adjusting this setting, you can have the AI assistant generate brief summaries or detailed explanations based on different use cases, while effectively managing token consumption costs.

About Tokens Tokens are the basic units used by AI models to process text. Generally speaking: - Chinese: 1 character is approximately 1.5-2 Tokens - English: 1 word is approximately 1-1.5 Tokens - Punctuation marks also count toward the token count

Configure Max Output Tokens

Navigate to Settings Page

Click "**AI Assistant**" in the left menu

Select the AI assistant you want to configure

Click the "**Settings**" button

Switch to the "**Advanced Settings**" tab

Adjust Token Limit

Select Token Limit Mode

"**Use Model Maximum**": Directly apply the maximum output tokens supported by the selected model (default)

"**Custom Amount**": Specify the limit yourself

Enter Custom Value (when "**Custom Amount**" is selected)

Enter the target value in the number input field

The available range depends on the selected model, and the screen will display the allowed range in real time (e.g., "Range: 512 - 64000 tokens" as shown below)

Save Settings

Click the "**Save**" button

Settings take effect immediately without restarting the AI assistant

AI assistant advanced settings page: Choose "Use Model Maximum" or "Custom Amount" to control the max output token limit

Important Notes - Setting the value too low may cause responses to be truncated, affecting completeness - Setting the value too high will increase token consumption costs - It is recommended to adjust based on actual needs and find the optimal balance through testing

Recommended Settings

Below are recommended token limit settings for different use cases:

Use Case	Recommended Tokens	Description
Quick Q&A	256 - 512	Suitable for quick answers, such as FAQ bots Approximately 100-200 Chinese characters
General Customer Service	512 - 1024	Balances detail and cost Approximately 200-400 Chinese characters
Professional Consultation	1024 - 2048	Provides detailed explanations and solutions Approximately 400-800 Chinese characters
Content Generation	2048 - 4096	Generates long-form articles or reports Approximately 800-1600 Chinese characters

Use Case	Recommended Tokens	Description
Code Generation	1024 - 2048	Produces complete code snippets Including comments and explanations

Use Case Examples

Scenario 1: FAQ Quick Response Bot

Requirement: Common customer questions need short and clear answers, avoiding lengthy explanations

Configuration:

- Max output tokens: 256-512
- System prompt: "Please answer questions in a brief and clear manner, no more than 3 sentences"
- Expected result: Quick responses, reduced token consumption

Example conversation:

```
User: What are your business hours?
AI: Our business hours are Monday to Friday from 9:00 AM to 6:00 PM,
Saturday from 10:00 AM to 5:00 PM, and we are closed on Sundays.
```

Scenario 2: Technical Support Detailed Explanation

Requirement: Users encounter technical issues and need detailed step-by-step instructions

Configuration:

- Max output tokens: 1024-2048
- System prompt: "Please provide detailed step-by-step instructions to ensure users can follow along"
- Expected result: Complete troubleshooting guide

Example conversation:

User: What should I do if the software won't start?

AI: Please follow these steps to troubleshoot:

1. Check System Requirements
 - Operating System: Windows 10 or above
 - Memory: At least 4GB
 - Disk Space: At least 2GB
2. Reinstall the Software
 - Remove the existing version (Control Panel > Programs)
 - Download the latest version [link]
 - Run the installer as administrator
3. Check Firewall Settings
 - Add the software to the exception list
 - Allow the software to access the network

If the above steps don't resolve the issue, please provide a screenshot of the error message and we will assist you further.

Scenario 3: Content Summary Generation

Requirement: Extract key summaries from long articles

Configuration:

- Max output tokens: 512-768
- System prompt: "Please organize key points into 3-5 bullet points, each no more than 2 sentences"
- Expected result: Concise summaries that are easy to quickly understand

Relationship with Other Settings

System Prompt

Even with a high token limit, the system prompt can still constrain response length:

Good example:

"Please answer concisely unless the user requests a detailed explanation"

Bad example:

"Please answer every question as thoroughly as possible" (may lead to overly long responses)

Model Selection

Different models support different maximum output token counts. When you switch the model used by the AI assistant, the customizable range will change accordingly, and the range hint displayed on the screen reflects the upper and lower limits of the currently selected model. When "Use Model Maximum" is selected, the system will automatically apply the maximum value for that model.

Cost Optimization Recommendations

Calculate Token Consumption

Token consumption per conversation includes:

- **Input Tokens:** User question + conversation history + system prompt
- **Output Tokens:** AI response (limited by this setting)

Example calculation:

```
Input: User question 50 Tokens + Conversation history 200 Tokens + System prompt
100 Tokens = 350 Tokens
Output: AI response (limit set to 512 Tokens)
Total: 350 + 512 = 862 Tokens (maximum)
```

Optimization Strategies

Adjust by scenario

Use a low token limit for simple questions

Only increase the limit for complex questions

Avoid unnecessary long responses

Explicitly require conciseness in the system prompt

Use multi-turn conversations instead of single long responses

Regularly review usage

Use the "Usage Analytics" tab to view conversation word count and other usage trends

Adjust settings to optimize costs

For detailed cost calculations and optimization recommendations, please refer to [Usage Calculation](#).

FAQ

Q: After setting the token limit, will the AI response be forcibly truncated?

A: Yes. When the AI-generated response reaches the token limit, it will stop at that point, which may result in incomplete sentences. Recommendations:

- Set an appropriate limit (not too low)
- Include in the system prompt: "End naturally before reaching the character limit"

Q: How do I check the average token usage of my AI assistant?

A: Go to the AI assistant "Settings" page and select the "Usage Analytics" tab. You can view trend charts by date range for "Conversation Word Count", "Conversation Count", "Message Count", "Average Conversation Interactions", and "User Satisfaction". The "Conversation Word Count" represents the cumulative word count generated by the assistant. Word count is positively correlated with token count and can serve as a reference for token consumption.

AI assistant "Usage Analytics" tab: View trend charts by date range for conversation word count, conversation count, message count, average conversation interactions, and user satisfaction

Q: Does setting a higher token limit slow down response speed?

A: There is a slight impact. Longer responses require more generation time, but the difference is usually minimal (within a few seconds). The main factors affecting speed are:

- Model selection
- Network connection speed
- Server load

Q: Do different languages require different token limit settings?

A: It is recommended to adjust accordingly:

- **Chinese:** The same amount of text consumes more Tokens, so consider slightly increasing the limit
- **English:** Token efficiency is higher, so a lower limit can be used
- **Multi-language environments:** It is recommended to set a higher limit to ensure flexibility

Q: Does the token limit affect knowledge base retrieval results?

A: It does not directly affect retrieval, but it affects how retrieval results are presented:

- **High token limit:** Can reference more knowledge base segments
- **Low token limit:** Only references the most relevant segments

Testing and Adjustment

Testing Process

Set Initial Value

Start with the recommended value (e.g., 1024)

Conduct Test Conversations

Enter typical user questions

Observe response length and completeness

Evaluate Results

Is the response complete?

Is there unnecessary verbosity?

Is token consumption reasonable?

Adjust Gradually

Too long → Lower the token limit

Too short/truncated → Increase the token limit

Continuous Monitoring

Regularly review usage

Fine-tune based on actual needs

Testing Examples

Test 1: Token limit 256

User: Please introduce your company

AI: We are a company focused on AI technology, providing enterprise-level chatbot solutions. [Response truncated]

Evaluation: Too short, need to increase

Test 2: Token limit 1024

User: Please introduce your company

AI: We are a company focused on AI technology... [Complete detailed introduction]... Feel free to contact us to learn more.

Evaluation: Appropriate, adopt this setting

Extended Features - [Create an AI Assistant](#) - [System Prompt Design Guide](#) - [Usage Calculation](#) - [Usage Analytics](#)

Knowledge Base

Knowledge Base Overview

What Is the Knowledge Base?

After creating an AI assistant, the next step is to set up the **knowledge base**, which serves as the data source for the AI assistant when answering questions.

How the knowledge base works:

Knowledge Base Operation Diagram

Think of the knowledge base as an open-book exam. The AI assistant finds the most relevant content from the knowledge base to use as the basis for its answers.

Although the knowledge base can hold a large amount of data, it is still recommended to upload content that is highly relevant to the assistant's tasks. If the content is irrelevant, current retrieval technology may still find unrelated information to use as answer context, leading to inaccurate responses.

What Can the Knowledge Base Do?

With the following knowledge base features, you can:

Tag-Based Document Management

You can add multiple tags to each document to create a systematic classification structure

Example: Add `#tent` `#beginner` `#setup-guide` tags to the "Tent Manual"

Selective Document Permissions

You can set different document access permissions based on user identity to provide differentiated services

Example: Product price lists are only accessible in VIP member conversations, while cost data is only accessible in internal conversations

Create FAQ

You can organize frequently asked questions into a standard Q&A set to ensure response consistency and completeness

Example: "How many years is the tent warranty?" → Standard answer: "We provide a 3-year warranty service"

Document Metadata Input

You can add detailed information such as version, update date, and applicable scope to documents for easier future maintenance

Example: Document version v2.1, update date 2024/11/28, applicable product "Mountain Series Tents"

Search Testing

You can test retrieval results for different questions to verify whether the AI finds the correct data segments

Example: Enter "tent setup steps" → Check whether the AI finds the correct setup guide segment

How to Upload to the Knowledge Base?

For example, suppose a knowledge base administrator at a publishing company wants an AI assistant to search the contents of product e-books. The administrator uploads EPUB e-books to the product knowledge base. Once processing is complete, the AI assistant can search the books for information to answer questions, just as it can with PDF or Word documents.

Go to the left sidebar "[AI Features](#)" → "[Knowledge Base](#)"

Find the knowledge base you want to upload to and click "[Edit](#)" in the Actions column (if you haven't created one yet, please refer to [How to Create a Knowledge Base: Basic Settings](#))

On the settings page, click the "[Knowledge Base](#)" tab

Click the blue "[Upload File](#)" button in the upper-right corner of the page to upload the data you want the AI assistant to know

You can check the processing progress in the "Processing Status" column.

ID	Document Name	Document Format	Document Size	Processing Status	Processing Time
5071a0e0-0001-4000-8000-000000000000	20240808-0001-4000-8000-000000000000.pdf	pdf	1.2 MB	Processing	2024-08-08 10:00:00
5071a0e0-0001-4000-8000-000000000000	20240808-0001-4000-8000-000000000000.pdf	pdf	1.2 MB	Done	2024-08-08 10:00:00

Currently supported file types for the knowledge base: Spreadsheet files: .xls, .xlsx, .csv, .ods Word processing files: .doc, .docx, .odt, .pdf, .md, .txt Presentation files: .ppt, .pptx, .odp Web files: .html, .htm Data formats: .json, .jsonl E-books: .epub Audio files: .wav, .mp3, .m4a, .aac Video files: .mp4

View Data

Data Chunk Description

When data is uploaded to the knowledge base, it is divided into chunks. This provides the following benefits:

- Improved retrieval accuracy:** Smaller chunks match queries more precisely, avoiding interference from irrelevant content
- Optimized response speed:** Faster processing with reduced computational resource consumption
- Enhanced content relevance:** Each chunk focuses on a single topic, improving specificity
- Easier maintenance and management:** Easier to update, track, and control quality
- Compliance with AI model limitations:** Avoids exceeding input length limits, ensuring information completeness

Edit and View Chunk Content

You can view the segmented content of your documents:

- Go to the document page in the knowledge base, and click "Edit"
- View the segmented content by clicking on the chunk you want to view

The screen will display the complete content of the chunk in Markdown format.

Edit Source Document

On the edit page, click "**View Document**"

Enter the edit page, where the text box will display the document in Markdown format

You can edit your source document in the text box. All file formats can be edited using this method. After finishing, click "**Save**" to save your edits.

Data Management Reminder It is recommended to back up important content before editing After editing the source document, the system will re-segment the data into chunks

How to Create a Knowledge Base: Basic Settings

Basic Settings

General Information

You can define the name of the knowledge base and add a description on the following page:

Retrieved Chunks

The number of retrieved chunks represents the maximum number of data chunks the AI assistant will reference when answering. The system default is "12", meaning the AI assistant will retrieve the 12 most relevant chunks for each response.

You can increase or decrease the number of retrieved chunks to adjust the amount of information the AI assistant references when answering.

Force the Full Retrieval Range

When an AI assistant in Agent mode queries a knowledge base, the model decides how many chunks to retrieve. It may use fewer than the "Maximum Retrieved Chunks" setting. When you select **Force Full Retrieval Range**, the system ignores the model's chosen count and supplies all results within the "Maximum Retrieved Chunks" range to the model.

This option is off by default. Find it under the AI assistant's **Settings** → **Advanced Settings** → **Knowledge Base Settings**, below the **Maximum Retrieved Chunks** field.

When to enable it:

Your knowledge base contains long tables, such as plan comparisons, price lists, or specification tables, that are split into multiple chunks and require more chunks to answer fully

Answers often cover only part of the information even though search tests find the other relevant chunks

Trade-offs:

The model reads more chunks for each response, so response times may increase

More chunks may include content that is less relevant to the question

The actual number of chunks supplied is determined by "Maximum Retrieved Chunks." Keep it within the on-screen recommended range of 5–15, compare answers to the same questions before and after enabling the option, and then decide whether to keep it.

Use case: Sales assistant Ann notices that the "Implementation Consultation Assistant" sometimes lists only some plans when answering comparison questions. She enables "Force Full Retrieval Range" in the assistant's advanced settings and saves. She then asks in Internal Chat, "Using the plan comparison table, list the differences in features and quotas for each plan." After querying the knowledge base, the assistant presents the differences in a table.

Open **AI Assistants**, click the edit icon beside the assistant you want to adjust, and open the **Settings** tab.

In the left menu, click **Advanced Settings**. In **Knowledge Base Settings**, select **Force Full Retrieval Range**.

Click **Save** at the bottom right.

Switch to the **Conversation Platforms** tab. Under **Internal Chat**, click **Go to Chat**, ask the question that previously received an incomplete answer, and compare the responses.

請依方案比較表，列出各方案在功能與額度上的差異

AI 助理 (RAG / Agent)	可設定	可用	可用	可用
官方內建				

Ask in Internal Chat; the assistant queries the knowledge base and presents plan differences in a table

If answer quality does not improve or responses become noticeably slower, clear the option and save to let the model choose how many chunks to use again.

Similarity Threshold

The similarity threshold excludes chunks that are not sufficiently relevant to the question. Chunks with a similarity score below the threshold will not be retrieved. Enter a value from 0 to 1 in increments of 0.01. Leave it blank or set it to 0 to disable filtering.

A higher threshold narrows the retrieval results, but it may also exclude useful content. Make small adjustments each time and compare the search results using the same set of questions.

Use case: Customer service manager Ching notices that search tests for "return conditions" occasionally include unrelated delivery information. She first records the original retrieval results, then raises the similarity threshold and saves the setting. Finally, she tests again using the same question. If the return policy chunk still appears while the delivery information is excluded, she can keep this setting.

Go to [Knowledge Bases](#) and click "Edit" on the right of the knowledge base you want to adjust.

Switch to [Retrieval Settings](#).

Enter a value in "Similarity Threshold (0–1)."

Click "Save," then use [Search Test](#) to retest the original question.

Adjust the similarity threshold in Retrieval Settings

What Is a Parser?

A parser enables the system to "understand" the content in uploaded documents, making it searchable, editable, or convertible to other formats.

Document Parsers

When uploading PDF, Word, or other documents, you can choose from the following four parsers (the default for PDF, Word, and PPT is **Auto Detect (Default)**; other formats default to MaiAgent Parser):

MaiAgent Parser: Low cost, fast speed, suitable for plain text documents, supports 22 formats

MaiAgent Parser (Online): Uses LLM, can OCR-parse text in images, supports 20 formats

MaiAgent Parser (Offline): OCR + AI semantic understanding of images, best structure preservation, deployable on-premises, supports 20 formats

Vision Parser: AI visual understanding, best image parsing results, supports 7 formats

When uploading PDF, Word, or PPT files, the default value in the **Parser** menu is **Auto Detect (Default)**. After upload, the system selects a parser based on the file structure. Scanned files, PDFs with many image pages, Word files with embedded images, and PowerPoint files may use MaiAgent Parser (Online), MaiAgent Parser (Offline), or Vision Parser instead, and credits are charged according to that parser's pricing. The parser ultimately used appears in the **Parser** column of the document list. If you later switch to a parser that has not previously been used for the file, the system reparses it and charges credits according to the new parser's pricing; credits charged for the previous parse are not refunded. MaiAgent Parser (Online) charges by the actual number of billable pages, and every reparse incurs another charge. To choose the parser and its pricing yourself, specify a parser when uploading. For pricing details, see [Technical Manual - Auto Detect \(Default\) and Parsing Charges](#).

Speech-to-Text Parsers

When uploading audio files, you can choose from the following four speech-to-text parsers:

Azure Speech: Real-time transcription with high accuracy

Whisper (Groq): Fastest speed, low cost

Whisper (OpenAI): Stable and reliable cloud solution

Whisper (Offline): Fully local deployment, free with data privacy protection

After audio parsing is complete, you can view the transcript via "View Document" and download the transcript file in TXT or SRT format:

Transcript view

Download transcript (supports TXT and SRT formats)

For a detailed comparison of each parser, refer to: [Technical Manual - Parser Tools](#)

If issues occur during data parsing, you can click the [Re-parse] icon to have the parser reprocess the data.

How to Adjust Documents with Complex Layouts

For documents such as product catalogs and specification sheets that contain two-column layouts, tables spanning multiple pages, and images, correct parsing does not guarantee that complete content will be retrieved for every question. We recommend checking each stage in order: parsing results → retrieval results → response results.

Choose a parser suited to the content first: Use the default parser for plain-text documents. When fields and table structures must be preserved, prioritize comparing the results from MaiAgent Parser (Offline). If the questions focus on labels in images, the appearance of parts, or relationships between images and text, compare the results from Vision Parser.

Inspect the parsed Markdown: Open "**View Document**" on the document page and confirm that the reading order of the left and right columns, table titles, column names, row data, and image descriptions remain in the same section. If content is interleaved or missing at this stage, switch parsers and parse the document again. If necessary, convert the source document to a single-column layout, or save important tables separately as `.xlsx`, `.csv`, or Markdown files and upload them.

Run search tests with representative questions: Test the product name, exact fields in tables, and questions that require comparisons across rows. Confirm that the required data appears in the retrieved chunks. If the correct chunk falls outside the retrieval range, gradually increase the number of "Retrieved Chunks" and compare the results. Increasing the number of chunks also introduces more irrelevant content, so we do not recommend setting it to the maximum immediately.

Make each chunk independently understandable: If a table is split, add the product name, specification category, field names, and units to each section. For data that requires highly complete responses, you can also create an FAQ that organizes frequently asked comparison questions into complete question-and-answer pairs.

Confirm the purpose of images: A Parser can recognize text or visual semantics in images, but this does not guarantee that responses will automatically display the original images. If users must see an image,

confirm that the parsed Markdown retains it and that the chunk containing the image is retrieved. Also test how it is displayed in the actual conversation channel being used. If you only need specification details from an image, include the key text, figure number, and image description in the document.

Adjust only one setting at a time and rerun the search test with the same set of questions. This lets you determine whether the improvement comes from the parser, document content, or retrieval settings.

Retrieval Model Settings

In the knowledge base settings, you can select the Embedding model and Reranker model you want to use.

Embedding Model

Embedding is like translating human language into a "numerical language" that AI can understand, enabling computers to comprehend the true meaning of text. This process is called "vectorization." Different Embedding models have different characteristics, such as the languages they handle best and the deployment environments they support. Different model settings in the knowledge base can be used to adjust the vectorization results when documents are uploaded. You can choose the most suitable Embedding model for different scenarios.

You can freely choose from multiple Embedding models:

For details on Embedding model differences, refer to: [Technical Manual - Embedding Models](#)

Reranker Model

A Reranker acts like a professional judge that re-evaluates which data best answers the customer's question from the initial search results. What is the difference between using a Reranker and not using one?

When a customer asks: "What tent is suitable for beginners? Budget under 8,000"

Without Reranker:

AI may respond:

"We have tents at various price points. Products at 8,000 include ... "
(May mention advanced models, not targeted enough for beginner needs)

With Reranker:

AI responds:

"Here are some specially recommended tents under 8,000 for beginners ... "
(Precisely targeted for beginners + budget + product recommendations)

When search result reranking is enabled, the AI assistant will re-sort the retrieved knowledge base chunks and respond based on the most relevant documents.

For details on the Reranker model, refer to: [Technical Manual - Reranker Models](#)

In summary, using Embedding combined with Reranker enables the AI assistant to understand the knowledge you provide, review content importance after retrieving chunks, and respond using the knowledge most relevant to the question.

Associated AI Assistants

Multiple AI Assistants Sharing a Knowledge Base

Associating AI assistants means authorizing specific AI assistants to use this knowledge base. If you have two AI assistants:

Product Customer Service AI

Order Customer Service AI

When both need to answer return-related questions, you can associate both AI assistants under the "**Return Policy**" knowledge base settings:

Diagram of associating multiple AI assistants

Select the AI assistants to associate

Click to add the AI assistant

After adding, it will appear in the selected AI assistants area. Click "Save" in the bottom-right corner to complete the association.

Once associated, both AI assistants can share the "**Return Policy**" knowledge base and respond based on the same content. For ongoing maintenance, you only need to **update one knowledge base** to ensure the AI assistants use the latest data.

One AI Assistant Using Multiple Knowledge Bases

In addition to sharing knowledge bases, a single AI assistant can also use multiple knowledge bases.

Go to the AI assistant page, select the AI assistant you want to configure, and click Settings

Go to Model Settings and click "Select Knowledge Base"

Select the knowledge bases to use and click Confirm. The selected knowledge bases will appear in the list

Finally, click "Save" and the AI assistant will be able to use multiple knowledge bases

How to Use the Crawler (Web Scraping) Feature

Purpose and Benefits

As a business user, you may often be asked by a manager to consult or compile regulations published on websites, or to keep an AI assistant up to date with the latest product information and FAQs on your company's website.

If you have a technical background or help from an engineer, you might automate data collection with a crawler. For nontechnical users, however, collecting pages by hand takes time and effort and can easily miss important information.

MaiAgent's No-Code web scraping feature lets you:

Crawl an entire website scope at once: Set the crawl depth, page limit, and URL rules to choose which pages to crawl.

Run once or on a recurring schedule: Crawl immediately, or recrawl automatically every day, week, or month.

Import automatically into a knowledge base: Import crawled pages directly into a selected knowledge base. For URLs that already exist, choose to skip, overwrite, or allow duplicates.

Track import results: See how many pages succeeded or failed in each import record.

Use Case

A customer service manager wants her AI support assistant's answers to stay consistent with the FAQs on the company website. She creates a knowledge base for those FAQs, then opens **Crawler** and creates a crawl request. She enters the website's FAQ URL and sets a low maximum crawl depth and page limit so she can first confirm that only FAQ pages will be crawled. She chooses **Scheduled run** for every Monday at 9 a.m., selects the new knowledge base as the automatic import destination, and chooses **Skip** when a URL already exists. The weekly synchronization task then appears on the Schedules tab. After each crawl, she can open **Import history** in the crawl request details to see which knowledge base received the pages and how many succeeded or failed. When the website's FAQs change, she no longer needs an engineer to compile the content again.

How Do I Crawl a Website?

If Crawler does not appear in the left menu, your account does not have access to it. Contact your organization administrator to confirm your permissions.

1. Open the Crawler Page

In the left menu, click **AI Features** → **Crawler**. The page has two tabs:

Page crawl requests: Lists every crawl, including one-time runs and crawls started automatically by schedules. Search by name or URL, and filter by type (one-time/scheduled) and crawl status (completed/in progress/failed).

Schedules: Lists all recurring crawl schedules.

ID	名称	URL	类型	爬取状态	创建时间	操作
1	爬取 豆瓣电影数据	https://movie.douban.com	定时	完成	2025-03-26 17:42:48	查看详情 删除 收藏

Page crawl requests tab: each request shows its type, crawl status, and creation time

2. Enter a Task Name and URL

Click **Create page crawl request** in the upper right. The setup flow has three steps: **URL**, **Crawl settings**, and **Execution method**.

In the first step, enter:

Task name: A name that helps you identify this crawl, such as “Daily product page crawl.”

URL: The URL where crawling should start.

Then click **Next**.

Advanced settings: narrow the crawl scope with URL rules, boundaries, and a sitemap strategy

Enabling **Allow external links** crawls URLs outside your website and may greatly increase the number of pages and the cost. Start with a small depth and page limit to confirm the scope before increasing them.

When you finish, click **Next**.

4. Choose an Execution Method and Knowledge Base

The third step, **Execution method**, determines when to crawl and where to import the results.

Execution method

One-time run: Start one crawl immediately after creating the request.

Scheduled run: Crawl according to a recurring schedule (see [Set Up a Recurring Schedule](#) in the next section).

Knowledge base settings

Import into an existing knowledge base: Under **Automatic import destination (optional)**, select one or more knowledge bases. Pages are imported automatically after crawling. Leave this empty to crawl without importing; you can import manually later.

Automatically create a new knowledge base: Create a new knowledge base named after the task on each run and import the crawled content into it.

After selecting an import destination, you can choose **How to handle existing URLs** for URLs already imported into that knowledge base:

Option	Description
Skip (default)	Skip URLs already imported into this knowledge base.
Overwrite	Replace the existing file with newly crawled content.
Allow duplicates	Create a new file even if the URL already exists.

Execution method: choose a one-time run, an automatic import destination, and how to handle duplicate URLs

When synchronizing the same website regularly, choose **Skip** or **Overwrite** to avoid accumulating duplicate files that could cause the AI assistant to cite outdated content.

5. Preview and Create

Before creating the request, click **Preview** to check which pages will be crawled. The preview explores website URLs and incurs a charge. A confirmation dialog appears first; click **Confirm** to proceed.

The preview shows the number of URLs found, URLs to crawl and exclude, estimated pages and time, and a list of pages to crawl.

Preview: check the number and list of pages before creating the request

The preview is an estimate. Actual crawling may vary because of depth limits, dynamic JavaScript pages, and robots.txt.

If everything looks correct, click **Create**. A one-time request appears on the **Page crawl requests** tab and starts crawling.

If the URL was crawled before, a **This URL has been crawled before** confirmation dialog shows the previous crawl time, page count, and imported knowledge bases. To crawl it again, click **Crawl again**; otherwise, click **Cancel**.

Set Up a Recurring Schedule

When website content changes regularly, choose **Scheduled run** in step 3 to recrawl and import into a knowledge base automatically.

Field	Description
Frequency	Once, Daily, Weekly, or Monthly.
Time zone	Time zone used for the schedule.
Start date End date	Period when the schedule is active. End date is optional; a one-time frequency only requires a start date.
Execution time	Time of each run.
Days of the week	For weekly schedules, select the days to run (multiple selections allowed).
Day of the month	For monthly schedules, enter a day from 1–31.

Scheduled run: crawl every Monday at 9 a.m. and import into a knowledge base automatically

After creation, the schedule appears on the **Schedules** tab with its settings and status (**Active** **Paused**). The action icons let you:

Edit: Open **Edit schedule** to change the task name, crawl settings, schedule time, and knowledge base settings. The starting URL cannot be changed after creation.

Execution history: View the time and crawl status of each run and open its details.

Pause

Enable: Temporarily pause or re-enable the schedule.

Delete: Delete the schedule.

ID	名稱	URL	排程設定	狀態	建立時間	操作
12345678901234567890	示範－官網 FAQ 同步	https://www.example.com	每週一上午 9 點 2024-10-28 09:00	已啟用	2024-10-28 09:00	編輯 預覽 暫停 刪除

Schedules tab: view settings, edit a schedule, check its execution history, pause it, or delete it

Each scheduled run crawls pages and consumes Credits. Pause the schedule when you temporarily do not need synchronization.

View Crawl Results and Import History

On the **Page crawl requests** tab, click **Details** for a request to open the **Crawl request details** page:

Crawl progress: Number of pages processed and total pages.

Crawl task settings: Expand to review the URL, crawl settings, and execution method chosen at creation.

Crawled pages: Titles, URLs, crawl statuses, and completion times of the pages crawled.

Crawl request details: view progress and crawled pages

Switch to the **Import history** tab to see each import's time, knowledge base, **Import method** (automatically imported pages show **Automatic**), and counts of successful and failed pages.

Import history: see the knowledge base, import method, and success/failure counts for each import

Click the action icon to open the **Imported pages list** and review each page's import status and corresponding knowledge base file.

標題	URL	導入狀態	知識庫檔案 ID	知識庫檔案
Example Domain	https://example.com/	成功	Example-123456789	Example-123456789

Imported pages list: find the knowledge base file created for each page

On the **Page crawl requests** list, you can also click **View** on a completed request to open **Failed import records**. Select a knowledge base to see which pages failed to import and why.

Imported content appears as .md files in the knowledge base's document list. You can set tags and metadata just as you can for other files. The **Source** column shows a **Crawler** tag; click it to return to the corresponding crawl request details.

Manually Import Crawled Pages

If you did not set up automatic import or want to import pages into another knowledge base, import them manually:

On the crawl request details page, click **Import into knowledge base** (or click **Import** for the request in the list).

Select the target **Knowledge base** and **How to handle existing URLs**.

Select the pages to import, then click **Import**.

Import list

How to handle existing URLs

Import list

標題	URL
Example Domain	https://example.com/

Manual import: choose a knowledge base, duplicate URL handling, and pages to import

If you choose **Skip** and some URLs have already been imported, the system reports how many import tasks were created and how many duplicate URLs were skipped.

A manual import recrawls the latest page data and incurs a crawling charge.

Web Scraping Considerations

Make sure you have permission to crawl the target website's content.

Crawling, previewing, and manually importing all consume Credits. Start with a small maximum crawl depth and page limit to verify the scope before increasing them.

After crawling, use Search Test to check data quality.

If website content changes often, use a recurring schedule to keep the information current, and choose Skip or Overwrite to avoid duplicate files.

How to Create FAQ

How to Upload FAQ

Select Knowledge Base

Go to the left sidebar "AI Features" → "Knowledge Base", and click on the knowledge base where you want to create FAQ (if you haven't created one yet, please refer to [How to Create a Knowledge Base: Basic Settings](#)).

Add Q&A Content

Enter the knowledge base page, select the "FAQ" tab, and click the "+Create FAQ" blue button in the upper right corner to start adding Q&A content.

Create FAQ

The FAQ editor supports multiple answer formats:

Basic text formatting (bold, underline, italic, etc.)

Equations

Source code (HTML, XML)

Embedded links (videos, websites)

Videos provide reference links for users (the AI assistant cannot read video content yet)

[illegible]

建立 FAQ

- 問題

線上支付方式有哪些

- 答案

14px [Rich Text Editor Icons]

只支援 LINE PAY、APPLE PAY，其餘一概不接受

[Cancel] [Confirm]

After creation, you can click preview to confirm the answer content:

After adding, click "**Confirm**" to complete the FAQ creation. The AI assistant will then be able to reference your provided answers when responding:

When customers ask questions related to online payment methods, the LLM will respond based on the FAQ content:

This way, you can restrict the AI assistant's response scope and prevent it from providing incorrect or non-compliant answers.

Other Use Cases

Product Operation Guidance Q&A

Using **MaiAgent platform usage** as an example, suppose you need to help new users understand how to get started with the MaiAgent system. You can add the following Q&A in the FAQ section:

Question: What should I do if I don't know how to use MaiAgent?

When the answer is too long, you can click preview to confirm the full content

Answer preview screen

The AI assistant will explain MaiAgent's available resources and getting started steps based on your provided answer, and provide the links in your answer for users to reference:

Knowledge Introduction

Using **LLM technology introduction** as an example, suppose you run a technology education platform and need to explain what Large Language Models (LLM) are to the general public. You can add the following Q&A in the FAQ section:

Question: What is the working principle of LLM?

You can enter video links within the answer

Click Insert/Edit Media

Link input illustration

Media insertion preview

The AI assistant will respond based on the answer you set, and provide the video reference link for users to access:

FAQ Management and Maintenance Tips

Content Timeliness Management

Event information updates: Remove or update related content immediately after promotions or limited-time offers end

Policy synchronization: When company policies (such as return/exchange conditions, terms of service) change, ensure FAQ content is updated accordingly

Product information maintenance: New product launches, specification changes, discontinued products, and other information should be reflected in related Q&A promptly

Data-Driven Optimization

Answer quality improvement: Optimize answer content for high-frequency questions by providing more detailed and practical information

Gap analysis: Discover common questions not covered by FAQ through customer feedback and customer service records

Quality Control Mechanisms

Content accuracy checks: Regularly verify that links, contact information, and technical data in FAQ are correct

Tone consistency: Ensure all FAQ content aligns with brand tone and communication style

Multi-language version synchronization: If multi-language support is needed, ensure all language versions are kept in sync

You can check the hit count of FAQ entries to identify the most frequently asked question categories and update them regularly. For hit count details, please see: [Search Testing](#)

問題	答案	標題	元資訊	命中次數	操作
問題1	答案1	標題1	元資訊1	5	刪除 修改 新增
問題2	答案2	標題2	元資訊2	3	刪除 修改 新增
問題3	答案3	標題3	元資訊3	2	刪除 修改 新增
問題4	答案4	標題4	元資訊4	1	刪除 修改 新增
問題5	答案5	標題5	元資訊5	0	刪除 修改 新增

This management mechanism ensures the AI assistant always provides accurate, timely, and user-relevant responses, enhancing the overall customer service experience.

Document Management: Tags & Metadata

Since a Knowledge Base may contain a large number of documents or FAQs to manage, MaiAgent provides tag management and metadata management features, allowing you to categorize and organize large volumes of documents and FAQs.

Tag Management

When your Knowledge Base contains a large amount of data, the tagging system helps you quickly organize documents, FAQ attributes, or control reference material permissions. For example:

```
Product Data Knowledge Base (categorized by product information)
```

- └─ #Tent
- └─ #4-Person Tent
- └─ #3-Season Tent
- └─ #SnowPeak

```
Tutorial Content Knowledge Base (categorized by permission level)
```

- └─ #Non-Member
- └─ #Regular Member
- └─ #VIP

Add Tag

Click the Add button

Enter the tag name

After clicking Add, the tag you just entered will be displayed as follows, including ID, name, etc.

The ID can be used for granting document access permissions. For details, see [Technical Manual — Query Metadata Control Items](#)

Add Tags to Documents

After adding tags, go to the document page.

Click Edit File Information

Select tags

Add corresponding tags based on the document's requirements (you can select multiple tags).

The added tags will then be displayed next to the corresponding document:

Add Tags to FAQs

If you want to add hierarchical categorization or tag management for FAQs, you can:

Go to the FAQ management interface within the Knowledge Base, select the FAQ you want to edit, then click the Edit button

Select the tags to add, then click "**Confirm**"

The added tags will appear in the FAQ field.

Tag Access Control

You can control what different users see based on different tags. For example, VIP customers can view more advanced product tutorials, while non-members can only see general tutorials.

Filtering can be applied to both FAQs and documents.

If you want an AI Assistant to reference only files with specific labels by default across all conversation platforms without passing parameters with each call, configure it on the assistant settings page instead. See [Knowledge Base Label Filtering](#).

Label filtering conditions have two levels: "within a group" and "between groups." The interface presents them in plain language. Between labels in the same group, select "Include All Labels (AND)" or "Include Any Label (OR)." Between multiple condition groups, select "Match Every Group (AND)" or "Match Any Group (OR)." The previous interface displayed AND/OR buttons, but the meaning is the same. The following two examples explain how this works.

Include All Labels (AND)

"Include All Labels (AND)" allows access only to content that simultaneously matches every label in the group.

For example: If a conversation is a tutorial-related conversation with a non-member, you can use tag filtering to only open documents that simultaneously match the "Non-Member" and "Tutorial" tags for the AI Assistant to use.

As shown: After filtering, the AI Assistant can only use the beginner camping document, avoiding disclosure of irrelevant information in non-member conversations.

Include Any Label (OR)

For conversations with members, use "Include Any Label (OR)" so the AI Assistant can reference documents matching either Regular Member or Non-Member:

Members can see more document content than non-members, achieving tiered access control.

In label filtering, click "**Include All Labels (AND)**" or "**Include Any Label (OR)**" to switch how the group is evaluated (the figure below shows the previous AND/OR buttons in the same location). A sentence at the bottom of the builder describes the current conditions so you can confirm that the settings are correct.

For filtering results, refer to: [Internal Q&A Features](#)

Document Metadata Management

What Is Metadata?

Metadata is like a document's "ID card," recording detailed information about the document and helping the system better manage and use these documents.

Example: Beginner Camping.pdf

Metadata settings:

- Document version: v2.1
- Created date: 2024-03-15
- Last updated: 2024-11-20
- Next review: 2025-05-20
- Updated by department: Marketing
- Version status: Reviewed and approved for release

Why Use Metadata?

When data is complex and voluminous, using metadata helps you maintain data quality more conveniently and quickly by:

Improving Management Efficiency

Quickly identify document status and version information

Stay more organized when managing large volumes of documents in bulk

Reduce time spent on manual searching and verification

Ensuring Content Quality

Use the latest document versions

Track document update history and version status

Ensure the AI Assistant uses the latest and reviewed content

Set periodic review reminders to maintain data quality

Add Metadata to Documents

Go to the document page and click Edit File Information:

Switch to the Metadata tab and enter the metadata mappings

MaiAgent uses key-value pairs to store and retrieve metadata

初級露營.pdf

標籤 元資料

目前元資料

文件版本: v2.1

新增元資料

鍵名 數值

+ 新增元資料

元資料可以儲存文件的額外資訊，如作者、版本等。

保留字包含「url」，會覆蓋當預覽被引用文件時開啟的位置

取消 確定

After entering, click the "**Add Metadata**" button to add the key-value pair you just entered (you can add multiple metadata entries at once).

圖示	檔名	類別	大小	格式	鍵	值	操作
PDF	初級露營.pdf	PDF	2.1 MB	PDF	url	https://example.com/primary-camping.pdf	刪除 複製
PDF	中級露營.pdf	PDF	2.1 MB	PDF	url	https://example.com/intermediate-camping.pdf	刪除 複製
PDF	高級露營.pdf	PDF	2.1 MB	PDF	url	https://example.com/advanced-camping.pdf	刪除 複製

After adding, you can see the metadata you just added appearing in the field.

Add Metadata to FAQs

Go to the FAQ management interface within the Knowledge Base, select the FAQ you want to edit, then click the Edit button

Switch to the Metadata page, enter the values, then click Add Metadata

After entering all values, click "Confirm"

Custom URL Mapping

`url` is a reserved word in the metadata system. If you set `url: https:// ... your-specified-URL`, the URL you set will override the original file location when viewing citation snippets in conversations, opening your specified URL instead.

Example Scenario: Brand Spring Promotional Campaign

Original Settings:

```
title: "2025 Spring Sale Event Details"
content: "This event includes 20% off storewide, bonus gifts for minimum purchase amounts, and many more offers ..."
url: https://www.yourstore.com/spring-sale-2025
```

Usage Effect: When a user asks "What offers are available in the spring sale?" in a conversation:

The AI will cite this knowledge snippet to answer the question

When the user clicks the citation source, it will not open the internal file location

Instead, it will navigate directly to <https://www.yourstore.com/spring-sale-2025>, the official campaign page

The user can immediately see the latest event details, purchase buttons, countdown timers, and other dynamic content

Practical Scenarios:

Website Announcements: `url: https://www.company.com/announcements/system-maintenance`

Product Spec Pages: `url: https://www.product.com/specs/model-x1`

Customer Service Policies: `url: https://support.company.com/return-policy`

Event Registration: `url: https://events.company.com/register/webinar-2025`

The benefit of this setup is making AI responses more actionable -- not only providing information but also guiding users directly to relevant pages to take action, improving user experience and conversion rates.

Before Setting url

As shown below, before setting the url value, clicking a citation node and clicking any node (e.g., Beginner Camping.pdf) allows you to view the original document (you can configure whether to allow users to download original document files in the conversation platform):

Conversation Platform - Allow Citation Document Download Settings

View citation nodes

View original file location

After Setting url (Using Google as an Example)

Click the cited node file (Camping Precautions.txt) again. Instead of showing a document preview, it will open the Google homepage:

After setting the `url` field in metadata, when users see the AI Assistant citing that document in a conversation, they can click directly to navigate to the link you set for more complete information.

Move Knowledge Base Files

When you need to reorganize a knowledge base—for example, by department or product line, or to archive outdated content—use the **Move Files** feature to move files in batches to another knowledge base in the same organization. Moving files **does not reprocess or vectorize them**, and their file IDs remain unchanged. This makes it fast to move even large numbers of files without incurring additional processing fees.

You can move up to 1,000 files at a time. Process larger sets in multiple batches. Moves run in the background, so you can continue with other tasks while they are in progress.

1. Open the Move Window

There are three entry points. All of them open the same **Move Knowledge Base Files** window. The only difference is whether the system preselects the source knowledge base or files based on the entry point.

Entry Point 1: Upper Right of the Knowledge Base List

Click **Knowledge Bases** in the left menu to open the knowledge base list, then click **Move Files** in the upper-right corner. This entry point does not preselect a source and is suitable for planning moves among several knowledge bases at once.

Entry Point 1: The **Move Files** button in the upper-right corner of the knowledge base list

Entry Point 2: Move Icon in the Knowledge Base List

In the knowledge base list, click the move icon in the **Actions** column for a knowledge base. This entry point **preselects that knowledge base as the source**, making it suitable when you already know which knowledge base you want to organize.

Entry Point 2: The move icon in the **Actions** column of the knowledge base list

Entry Point 3: Select Files in a Knowledge Base's Document List

Open the **Documents** list on a knowledge base settings page. Select the files to move, then click **Move Files**. This entry point **locks the current knowledge base as the source** and preselects the files you just selected. After choosing the destination, you must still click **Move In** to add them to the pending move list. This is useful when selecting files to move while browsing documents.

Entry Point 3: On the knowledge base settings page, select files in the document list and click **Move Files**

2. Understand the Move Window

The **Move Knowledge Base Files** window uses a two-column layout. The left column contains files in the source knowledge base, and the right column contains files in the destination knowledge base. Use the buttons between them to move files from one column to the other:

Overview of the Move Knowledge Base Files window

Component	Location	Description
Source Knowledge Base drop-down menu	Upper-left area of the window	Select the knowledge base where the files are currently located
Destination Knowledge Base drop-down menu	Upper-right area of the window	Select the knowledge base to which the files will be moved. The destination must use the same vector settings as the source. When you submit the move, the system also checks that you have delete permission for both the source and destination
Swap button	Between the two drop-down menus	Quickly swap the source and destination without selecting them again
Search box	One in each column	Search by file name to quickly find files in long lists
Select all checkbox	Top of each column's file list	Select all files currently shown in the list at once (after a search, Select All selects only the search results)
Move In button (→)	Between the two columns	Add files selected in the left (source) column to the pending move list

Component	Location	Description
Move Back button (←)	Between the two columns	Add files selected in the right (destination) column to the reverse pending move list. Both directions can be processed in the same batch
Pending move indicator	File row	Files added to the pending move list are marked Pending Move In or Pending Move Back ; they have not actually been moved yet
Persistent notice	Bottom of the window	File IDs remain unchanged • No reprocessing or vectorization • 1,000-file limit per batch , reminding you of the feature's three key characteristics

The Edit permission shown in the window does not mean that move authorization has passed. When you submit, you must still have delete permission for both knowledge bases. Until you click **Confirm Move**, all Move In/Move Back actions only edit the pending move list. No files have actually moved, so you can safely adjust the list as often as needed.

3. Procedure

Select the Source and Destination Knowledge Bases

At the top of the window, select the **Source Knowledge Base** and **Destination Knowledge Base**. The destination drop-down excludes the source itself and filters knowledge bases by vector settings. Use the swap button between the menus to quickly exchange the source and destination. Seeing a knowledge base in the menu does not guarantee that the move can be completed; delete permissions for both the source and destination are checked when you submit.

Select Files and Add Them to the Pending Move List

Select files in the left (source) column, then click **Move In** (→) to add them to the pending move list. You can also select files in the right (destination) column and click **Move Back** (←). Moves in both directions can be submitted together in the same batch. For a long file list, filter it with the search box before using Select All.

Selected files have been added to the pending move list. Each file row is marked Pending Move In or Pending Move Back

A file's existing tags and Metadata are cleared after it is moved because tag definitions belong to the original knowledge base. To retain them, first create tags with the same names in the destination knowledge base, then apply the tags again after the move. When you add files to the pending move list, the system displays a warning that Tags for N files will be cleared.

Confirm the Move

The bottom of the window shows the number of pending moves. After confirming the count, click **Confirm Move**.

The pending move count appears at the bottom. Click **Confirm Move** to submit

After submission, the move runs in the background and the screen displays **Move in Progress**. You can work on other tasks in the meantime.

The move runs in the background without interrupting other tasks

View Move Results

When the move finishes, the **Move Results** page presents three summary cards: **Completed**, **Skipped** (already in the destination knowledge base), and **Failed** (the file remains in its original knowledge base). It also lists the reason for each file.

Move Results page: 1 completed, 0 skipped, and 0 failed. Click Move Another Batch to continue

If any files fail, click **Retry This Batch**. Retrying is safe: files that have already moved are skipped and are not processed twice.

To continue organizing other files, click **Move Another Batch** to return to the selection screen.

Move results are retained for 7 days. During that time, you can return to review them or retry a batch.

4. Limitations and Important Notes

Item	Description
Permissions	You need delete permission for both the source and destination knowledge bases. Edit permission alone is insufficient. Organization owners automatically have full permissions and require no additional configuration
Scope	Files can only be moved between knowledge bases in the same organization. Knowledge bases in other organizations do not appear in the drop-down menu
Vector settings	The destination knowledge base must use the same vector settings as the source. Knowledge bases with different settings do not appear in the drop-down menu
Files being processed	Files that are still being processed cannot be moved. Wait for processing to finish before moving them
Per-batch limit	1,000 files; process larger quantities in multiple batches
Files with the same name	The system does not deduplicate or rename files. If the destination knowledge base already contains a file with the same name, both files will exist after the move. Check before moving them
Tags and Metadata	Always cleared after a move and must be reapplied in the destination knowledge base (see the instructions below for how to preserve them)

Why Must the Destination Knowledge Base Use the Same Vector Settings?

Moving files can avoid reprocessing and vectorization because the system directly reuses each file's existing processed results and vector data, changing only its ownership. Vector data is generated from a knowledge base's vector settings. If the destination uses different settings, vectors from the source cannot be retrieved correctly in the destination. To prevent this, the **Destination Knowledge Base** drop-down only lists knowledge bases with the same vector settings as the source.

If you need to move files to a knowledge base with different vector settings, **upload the original files again in the destination knowledge base** so the system can process and vectorize them using its settings.

Why Are Tags Cleared, and How Can I Preserve Them?

Tag definitions—their names and purposes—belong to individual knowledge bases and are not shared across the organization. Tags in the source knowledge base do not exist in the destination, so a file's original tags and Metadata are always cleared after it is moved.

If tags are important to your retrieval or management workflows, follow these steps:

Before moving files, record or take a screenshot of their current tags.

Create tags with the same names in the destination knowledge base.

Move the files.

After the move, apply the tags to the files again in the destination knowledge base's document list.

5. Error Scenarios and Troubleshooting

Scenario	System behavior	Recommended action
Some files do not meet the requirements at submission time (for example, they are still being processed)	The entire batch is rejected. No files are moved, and the reason for each file is listed	Resolve or remove the problematic files based on the reasons shown—for example, remove files still being processed from the pending move list—then submit again
Files are being processed by a previous move batch	The system reports that they cannot be added and provides a Remove These N Files button	Click Remove These N Files to move the remaining files first, then process these files after the previous batch finishes
Some files fail during the move	Failed files remain in their original knowledge base , and the results page lists the reason for each file	Click Retry This Batch on the results page. Files already moved are automatically skipped, and only failed files are retried

The reject entire batch design is intentional. It prevents some files in a batch from moving while others fail, which would leave the knowledge base in a difficult-to-track state. Remove files that do not meet the requirements before submitting so the batch can complete successfully.

6. Use Cases

Financial Services: Split a Shared Knowledge Base by Department

A bank initially stores credit card, mortgage, and wealth management documents in a single **Customer Service Knowledge Base**. As the number of documents grows, its customer service AI assistant occasionally cites credit card promotions when answering mortgage questions. An administrator creates three knowledge bases—**Credit Cards**, **Mortgages**, and **Wealth Management**—using the same vector settings, then moves hundreds of documents to the corresponding knowledge bases by department. The files do not need to be reprocessed or vectorized, and no additional processing fees are incurred. After the split, each department's AI assistant only mounts its own knowledge base, producing more focused answers.

Manufacturing: Organize Catalogs and Specifications by Product Line

A sales inquiry assistant at an electronic components manufacturer originally uses one **Product Documents** knowledge base containing catalogs and specifications for connectors, cables, and power modules. During a reorganization, an administrator filters for connector-related files using the search box in the document list, selects them, and clicks **Move Files** (Entry Point 3) to move them into a new **Connector Product Line** knowledge base. The administrator then repeats the process for the other product lines. Because file IDs remain unchanged, internal records that reference those IDs are unaffected.

Education: Archive Content at the End of a Semester

A university's admissions and academic affairs AI assistant knowledge base contains many course announcements and calendars for the current semester. At the end of the semester, an administrator moves outdated documents to a **Past Semesters Archive** knowledge base. This keeps the active knowledge base streamlined and prevents the AI assistant from citing outdated information, while the archived content remains available to internal search assistants. Repeating the process each semester creates a consistent knowledge base lifecycle management workflow.

Healthcare: Reorganize Patient Education Materials by Department

A hospital initially stores its patient education materials in a single knowledge base, then decides to split them by department, such as family medicine, orthopedics, and obstetrics and gynecology, so that each department's LINE patient education assistant mounts the appropriate knowledge base. Because most patient education files have tags such as **Patient Education** and **Forms**, the administrator first creates tags with the same names in each department's knowledge base, then reapplies them after moving the files so tag filtering continues to work.

Retail and Hospitality: Rotate Seasonal Campaign Content

After a peak-season campaign ends, a hotel chain moves room type and campaign documents for its **Summer Promotion** from the online customer service knowledge base to a **Campaign Archive** knowledge base, while moving documents for the new campaign in. Because files can be moved in both directions in the same batch, the old and new campaign content can be swapped in one operation.

7. FAQ

Q: Are Files Reprocessed or Vectorized When Moved? Are There Any Fees?

No. A move directly reuses the existing processed results and vector data, changing only the file's ownership. It is therefore fast and does not incur additional processing fees. This is what the persistent

notice at the bottom of the window means: **File IDs remain unchanged** • **No reprocessing or vectorization** • **1,000-file limit per batch**.

Q: What If I Move a File to the Wrong Place?

Open the move window again, swap the source and destination using the button between them, and move the file back. Note that if the file originally had tags, they were cleared during the first move and are not automatically restored when you move it back. You must apply them again.

Q: Why Can't I Find the Destination Knowledge Base in the Drop-Down Menu?

The **Destination Knowledge Base** menu excludes the source itself and filters by vector settings. If a knowledge base is missing, check whether it belongs to **another organization** (cross-organization moves are not supported) or uses **different vector settings**. Even if you can select the destination, the system checks that you have **delete permission** for both the source and destination when you confirm the move. If you lack permission, contact the organization owner to adjust your role permissions.

Q: Will an Existing File with the Same Name in the Destination Be Overwritten?

No. The system does not overwrite, deduplicate, or automatically rename files. Both files with the same name will exist after the move. To avoid duplicates, check the destination's file list before moving or manually delete the unnecessary copy afterward.

Q: What If I Need to Move More Than 1,000 Files?

Process them in multiple batches. Use the search box and Select All in the left column to split files into batches by keyword. After each batch completes, click **Move Another Batch** to continue.

Q: How Long Are Move Results Available?

Move results are retained for 7 days. During that time, you can return to review the result for each file and click **Retry This Batch** for failed batches.

PDF Document Translation

Feature Overview

MaiAgent provides AI-powered PDF document translation, allowing you to translate PDF files in your knowledge base into a specified language. After translation, two versions are produced:

Translated version: Contains only the translated content in the target language

Bilingual side-by-side version: Displays the original text and translation side by side for easy comparison

Supported languages include: Traditional Chinese, Simplified Chinese, English, Japanese, Korean, Spanish, French, German, Portuguese, Russian, Arabic, Italian, Dutch, Polish, and Turkish.

Currently, only PDF format is supported for document translation, and the PDF must contain extractable text content (scanned/image-only PDFs are not supported).

How to Translate a PDF Document

1. Open the Document Details Page

In the **Documents** tab of your knowledge base, click the PDF file you want to translate to open the document details page.

PDF document details page with the "Translate PDF" button in the upper right corner

2. Open Translation Settings

Click the **Translate PDF** button in the upper right corner. If the file already has a translation record, the translation results dialog will appear first — click **Translate Again** to open the settings. For first-time translations, the translation settings dialog opens directly.

Translation settings dialog

3. Configure Translation Parameters

Field	Description
Source Language	The language of the original text. Defaults to "Auto Detect" — the system identifies it automatically
Target Language	The target language for translation (required)
Large Language Model	Select the LLM model to use for translation
Custom Terminology/Prompt	(Optional) Guide the translation style or specify terminology mappings, e.g., "Translate 'Hermione' as 'Miao-Li'"

The custom prompt supports up to 5,000 characters and is ideal for specifying proper nouns, brand names, or particular translation styles.

4. Start Translation

Click **Confirm** to start the translation task in the background. The status updates in real time during translation, and results are displayed automatically upon completion.

View Translation Results

After translation is complete, click the **Translate PDF** button to open the translation results dialog, which contains three tabs:

Result Preview

Preview the bilingual side-by-side PDF with the original text and translation displayed side by side.

Translation results — Bilingual side-by-side PDF preview

Download Files

Three file download options are available:

Original file: Download the untranslated original PDF

Translated version: A PDF containing only the target language translation

Bilingual side-by-side version: A PDF with the original text and translation displayed side by side

Download files — Three formats available

Processing Details

View complete statistics for the translation task:

Translation configuration: Source/target languages, LLM model used

Processing statistics: Token consumption, number of LLM calls, processing time breakdown

File information: File size and character count for both the original and translated files

Timestamps: Creation, start, and completion times along with the final status

Processing details — Token consumption and time statistics

Translation Version Management

A single PDF file can be translated multiple times (e.g., into different languages or using different models), and each translation is saved as a separate version.

Use the **Select Translation Version** dropdown at the top of the translation results dialog to switch between versions. The version format is: **Date | Source Language → Target Language | Model Used**.

To translate again, click the **Translate Again** button to open a new translation settings dialog.

Search Testing

Why Do You Need Search Testing?

Ensure Response Accuracy

The quality of AI assistant responses directly affects customer satisfaction

Incorrect or irrelevant answers damage brand trust

Avoid Information Gaps

Prevent important product details or safety instructions from being overlooked

Optimize the efficiency of knowledge base usage

Improve Q&A Consistency

Ensure the same question receives a consistent answer at different times

Avoid response instability caused by knowledge base updates

Through search testing and segment preview features, you can instantly review the quality of data segments used by the AI assistant to ensure your Q&A standards.

How to Get Started?

Go to the Knowledge Base page, select the knowledge base you want to view, and enter its settings

ID	设备名称	IP	品牌	系统版本	固件版本	固件大小	固件日期	固件大小
1	设备名称	192.168.1.1	品牌	系统版本	固件版本	固件大小	固件日期	固件大小
2	设备名称	192.168.1.2	品牌	系统版本	固件版本	固件大小	固件日期	固件大小

Click on Search Test to enter the page

Type the content you want to search in the dialog box: "What should I pay attention to when choosing a campsite?", then click the search button. The AI assistant will search for the most relevant documents based on your input.

View search results

The right side will display the segments that the AI assistant retrieves when answering. As shown in the figure, there are 12 segments (to configure the number of retrieved segments, refer to: [How to Create a Knowledge Base: Basic Settings](#))

The right side shows the retrieved content used to answer this question. Each segment displays:

Word count: The number of words covered by the segment

Hit count: The number of times the AI assistant referenced this segment when answering (only official Q&A sessions are counted; test Q&A sessions are not included in hit count calculations)

A higher hit count indicates that users ask more questions related to this segment.

Search test records past test Q&A sessions. You can quickly click on history records to retest, ensuring that the same topics maintain or improve data reference quality.

知識庫搜尋測試

輸入搜尋內容，測試知識庫的回傳效果

我要去露營，可以給我一些參考資料嗎

17 / 200

搜尋

搜尋歷史 清除歷史

我要去露營，可以給我一些參考資料嗎

露營要注意什麼呢？

露營要注意啥

Check Knowledge Segment Quality

Through search testing, you can determine which segments the AI assistant uses during reasoning, and then check whether the content of these segments needs optimization, such as:

If you find many blank segments in the search results, and these blank segments all belong to the file "[Beginner Camping.pdf](#)", you can then check whether the content of "[Beginner Camping.pdf](#)" is correct and update it immediately **before going live**.

Search Test by Metadata

What Is Metadata Search?

The Metadata search feature allows you to perform precise queries based on document attribute information, rather than being limited to the document content itself. This feature is particularly suitable for:

Document classification queries: Search by document type, tags, categories, and other information

Attribute filtering: Filter by document creation time, author, source, and other attributes

Precise targeting: Quickly find document collections that meet specific criteria

How to Use Metadata Search?

On the search test page, you can:

Select search mode: Switch to "Metadata Search" mode

Specify search criteria: Enter the metadata field and value you want to search

View search results: The system will display document segments that match the metadata criteria

Search examples:

Search for documents in a specific category: `category:Product Description`

Search for documents within a specific time range: `date:2025-01`

Search for documents by a specific author: `author:Customer Service Department`

Advantages of Metadata Search

1. More Precise Results

Query directly against document attributes, reducing irrelevant results

Suitable for scenarios that require precise filtering

2. Faster Targeting

No need for full-text search; quickly locate target documents

Especially suitable for knowledge bases with large volumes of documents

3. Combined with Content Search

Can be used in combination with regular content search

First narrow down the scope with metadata, then pinpoint with content search

Practical Use Cases

Scenario 1: Product Document Management

Search for all documents in a specific product line

Example: `product_line:Camping Equipment`

Scenario 2: Time Range Query

Find recently updated documents

Example: `updated_date:2025-11`

Scenario 3: Document Type Filtering

View only specific types of documents (e.g., operation manuals, FAQs, etc.)

Example: `doc_type:FAQ`

Search Testing Helps You

Test Important Questions Regularly

Test core business-related questions frequently

Retest after knowledge base updates

Record and compare improvements in test results

Identify Content Gaps

Discover knowledge gaps: Test common questions and find queries with no matching results

Example: Testing "tent waterproof rating explanation" reveals no relevant segments → waterproof specification documents need to be added

Evaluate Content Completeness

Check answer depth: Confirm whether the AI answer covers all aspects of the question

Example: Query "camping safety precautions" → Check whether it covers weather, wildlife, fire safety, and other aspects

Question Testing Tips

You can:

Ask the same question in different ways

Test complex scenarios and multi-condition queries

Verify the retrieval effectiveness of technical terms and product names

Use these testing tips to comprehensively evaluate the accuracy and completeness of responses.

Database

Text to SQL Feature

What is Text to SQL?

Text to SQL (also known as Text2SQL) is an intelligent tool that automatically converts **natural language questions** (everyday human language) into **SQL database query statements**. Simply put, it enables the AI Assistant to "**understand human language**" and directly operate on databases.

To learn more about Text2SQL, see: [Technical Manual — Text to SQL](#)

Imagine you are a convenience store owner:

Traditional approach:

You: "Help me check how many bottles of cola were sold yesterday"

Employee: "Boss, you need to teach me how to use the POS system to query..."

You: "Click here, select there, enter conditions..."

Requires hands-on instruction, which is time-consuming.

With Text2SQL:

You: "Help me check how many bottles of cola were sold yesterday"

AI Employee: "Sure!" (*automatically generates the query method and calls the database*) → "87 bottles of cola were sold yesterday"

Core Features of Text to SQL

Natural language question → AI understanding & analysis → SQL query statement →
Execute query → Return results

When you ask the AI Assistant "Find the best-selling beverage from yesterday," the AI Assistant first analyzes your question, understands that you want to find a "beverage" that sold the "best" "yesterday," then generates SQL syntax to query the database, and finally tells you the result: "cola."

What Text to SQL Can Help AI Accomplish

Use Cases

Medical Clinic

```
Doctor asks: "Find today's appointments for diabetic patients"
AI responds: "There are 5 diabetic patients with appointments today:
- Mr. Wang 10:00 follow-up visit
- Mrs. Li 14:30 follow-up checkup
- Ms. Chen 16:00 blood sugar monitoring"
```

School Management

```
Teacher asks: "How many students failed this exam?"
AI responds: "This math exam:
- Total students: 45
- Failed: 8 (17.8%)
- The list of students requiring a makeup exam has been compiled"
```

Retail Chain Store

```
Store manager asks: "Compare the monthly revenue of three branches"
AI responds: "November revenue comparison by branch:
- Taipei store: $1,200,000 (↑15%)
- Taichung store: $950,000 (↑8%)
- Kaohsiung store: $800,000 (↓3%)"
```

Advantages of Text to SQL

Efficiency Improvement

Traditional approach: Requires an SQL expert to write queries → 30 minutes

Text2SQL: Ask in natural language → 3 seconds

Lower Barrier

No need to learn complex SQL syntax

No need to memorize database structure

Anyone can query data

Real-Time Interaction

Ask and get answers immediately

Dynamically adjust query conditions

How to Use Text to SQL in MaiAgent

Before starting, you need to prepare: an enterprise relational database or Excel files (uploaded to the Knowledge Base) If using a database, it is recommended that you: Ensure the data table structure is clear Create appropriate indexes Maintain data quality

1. Access AI Assistant Settings

Select the AI Assistant you want to configure

Switch to the Response Mode settings page

The screenshot shows the 'Project Settings' window in Unity. The 'Project Settings' list on the right contains the following items:

Project Name	Project Path	Project Icon
MyProject	Assets/Scripts	Assets/Icons
MyProject	Assets/Scripts	Assets/Icons
MyProject	Assets/Scripts	Assets/Icons

A red circle highlights the 'Project Name' setting in the first row.

2. Switch the AI Assistant's Response Mode to Agent Mode

Make sure to switch to Agent Mode, otherwise the AI Assistant cannot use the Text to SQL feature. For detailed information about each Response Mode, refer to: [Create AI Assistant](#)

3. Enter the Enterprise Database URL

Use the dropdown menu to select the database service used by your enterprise.

Enter the database service URL used by your enterprise to allow the MaiAgent system to connect to the database.

- MaiAgent supports: MySQL PostgreSQL Oracle DB Microsoft SQL Server (MSSQL) - The maiagent option applies to Excel files you have already uploaded to the MaiAgent Knowledge Base

Make sure the URL format is correct and includes the necessary connection information, such as: hostname, port, database name, username, and password.

MaiAgent

Refer to: [Using MaiAgent Knowledge Base for Text to SQL](#)

Microsoft SQL Server(MSSQL)

Connect to an existing MSSQL database by pasting the MSSQL database connection string

Note: Ensure the database URL is accessible by the MaiAgent service

MySQL

Connect to an existing MySQL database by pasting the MySQL database connection string

Note: Ensure the database URL is accessible by the MaiAgent service

Oracle

Connect to an existing Oracle database by pasting the Oracle database connection string

Note: Ensure the database URL is accessible by the MaiAgent service

PostgreSQL

Connect to an existing PostgreSQL database by pasting the PostgreSQL database connection string

Note: Ensure the database URL is accessible by the MaiAgent service

4. Click Save to Store the Settings

With this setup, the AI Assistant can help you quickly query your inventory, employee information, and more, and compile well-organized reports and trends for you.

Troubleshooting

Connection failed: Check the database URL format and network connectivity

Query error: Verify that table names and field names are correct

Insufficient permissions: Check database user permission settings

Slow response: Check query complexity and consider adding indexes

Text2SQL turns the AI Assistant into a database expert, allowing anyone to quickly obtain business insights using natural language, greatly improving the efficiency of data-driven decision making!

Create & Configure a Database

MaiAgent's **Database Management** feature lets you centrally manage the database connections used by AI assistants on the platform. With Text to SQL, AI assistants can query data in a database directly using natural language.

For an introduction to Text to SQL, see [Text to SQL Feature](#).

MaiAgent supports two types of databases:

MaiAgent Database: Upload an Excel

CSV

JSON file, and the system automatically creates a table. Suitable for users who do not have their own database

External Database: Connect to an existing PostgreSQL, MySQL, SQL Server (MSSQL), Oracle, or SynxDB database

Create a Database

1. Open the Database Management Page

From the left navigation bar, open **AI Features** and click **Database**. The page has two tabs: **MaiAgent Database** and **External Database**.

Click **Add Database** in the upper right to begin.

Database management page showing the MaiAgent database list

If the button is grayed out and cannot be clicked, your role has not been granted permission to create databases. Contact your organization administrator to set up the permission.

2. Select a Database Type

Select the type of database you want to create. Click its card, then click **Next**:

MaiAgent Database: For uploading spreadsheet files; no connection string is required

PostgreSQL

MySQL

SQL Server

Oracle

SynxDB: Connect to an existing external enterprise database

Step 1: Select a database type

3. Enter Basic Information

MaiAgent Database

Field	Required	Description
Database name	Yes	For example, "2024 sales data"
Description	No	Additional details about the database's purpose or contents

A MaiAgent Database does not require a connection string; the system handles data storage automatically. After creating it, upload a spreadsheet file.

新增資料庫連線

3

MaiAgent 資料庫

* 資料庫名稱

例如：銷售資料庫、客運知識庫資料

說明 選項

輸入資料庫說明

建立後可在「管理表格」上傳 CSV、Excel 等檔案

AI 助理將能用自然語言查詢表格資料

← 上一步

取消

下一步 →

Step 2: MaiAgent Database settings

External Database

Field	Required	Description
Database name	Yes	For example, "Enterprise ERP database"
Description	No	Additional details about the database's purpose or contents
Connection string	Yes	The database connection URL
Specify tables	No	Limit the tables that AI assistants can query; separate table names with commas

The connection string formats are shown below (the format for the selected database type also appears below the field):

```
PostgreSQL: postgresql://username:password@host:port/database_name
MySQL:      mysql+pymysql://username:password@host:port/database_name
SQL Server: mssql+pyodbc://username:password@host:port/database_name?
            driver=ODBC+Driver+18+for+SQL+Server&TrustServerCertificate=yes&Encrypt=no
Oracle:     oracle+oracledb://username:password@host:port/?
            service_name=service_name
SynxDB:     postgresql://username:password@host:port/database_name
```

Make sure the connection string has the correct format and contains all required connection information. Its prefix must match the format above; otherwise, an "Invalid connection string format" message appears and you cannot continue to the next step. Also make sure the database URL is accessible to MaiAgent services.

新增資料庫連線

設定資訊

2

3

PostgreSQL

資料庫名稱

例如：銷售資料庫、客運知識庫資料

說明 選項

輸入資料庫說明

連線字串

postgresql://db_username:db_password@db_ip:db_port/db_name

格式：postgresql://username:password@db_ip:db_port/db_name

指定資料表 選項

users, orders, products

留空表示查詢所有資料庫；填寫後僅查詢指定的資料庫

取消連線

建議先測試連線，也可以跳過測試直接儲存

← 上一步

取消

下一步 →

Step 2: External database (PostgreSQL) settings

After entering the connection string, click **Test Connection** to check the connection (or skip the test and save directly):

Connection successful: MaiAgent can access your database

Connection failed: Check the connection string format, network connectivity, and whether the database allows external connections

If your database has many tables, enter the names of the tables you want to make available (for example, `customers, orders, products`) in **Specify Tables** to improve query efficiency and security. Leave this field blank to allow queries across all tables.

4. Configure Role Permissions

The final step is to choose which roles can access the database. Select one option under **Quick Select Permission Scope**:

All Roles: Allow members with any role in the organization to use this database

Exclude Default Roles: Allow only custom roles; exclude default roles

Select Roles: Choose specific roles manually by moving roles you want to authorize from **Available Roles** to **Selected Roles**

新增資料庫連線

← 上一步

取消

建立資料庫

Step 3: Quickly select the permission scope

If you do not need to configure role permissions yet, skip this step. You can adjust them later on the **Role Permissions** tab of the database settings page.

5. Finish Creating the Database

After reviewing the settings, click **Create Database** (MaiAgent Database) or **Save** (external database). Once the database is created, its settings page opens for further configuration.

New databases are disabled by default. On the **Basic Information** tab, turn on **Enable Database** and save, or toggle **Enable** in the database list. AI assistants can then use this database for Text to SQL queries.

After creating the database, remember to link it to an AI assistant so the assistant can query it. See [Link AI Assistants and Group Permissions](#).

Upload a File to Create a Table (MaiAgent Database)

After creating a MaiAgent Database, open its settings page and switch to the **Table Management** tab. Click **Upload Table File**, select a file or drag one into the upload area, and then click **Upload**.

Table Management tab, with tables grouped by source file

Supported File Formats

Format	Extension	Description
Excel	<code>.xlsx</code> , <code>.xls</code>	Creates a separate table for each worksheet (Sheet)
CSV	<code>.csv</code>	Comma-separated values file
JSON	<code>.json</code> , <code>.jsonl</code>	JSON data file

After upload, the system parses the file structure and creates tables in the background. Tables are grouped by source file and display their processing status:

Status	Description
Pending	The file has been uploaded and is waiting to be processed
Processing	The system is parsing the file and creating tables

Status	Description
Success	The table has been created and AI assistants can query it
Failed	An error occurred during creation; hover over the error icon to see the reason

File Format Notes

[x] The first row must contain **column names**

[x] Each column must have a consistent **data type** (for example, all values in a price column should be numbers)

[x] Avoid **merged cells**

[x] Avoid **duplicate column names**

[x] Each worksheet (Sheet) in an Excel file must contain **only one table**

Common reasons a table fails to be created include an invalid or damaged file, special characters in column names, duplicate column names, or inconsistent data types within a column.

Edit Column Descriptions

Column descriptions are a **key setting** for improving the accuracy of Text to SQL queries. AI assistants use them to understand what the data means and generate more accurate SQL queries.

For example, a table may have a column named `status` without explaining what it represents. Adding a description such as "Order status; possible values: pending (awaiting processing), completed (finished), cancelled (canceled)" helps the AI assistant interpret the column correctly.

How to Edit

MaiAgent Database: On the **Table Management** tab, click the **Edit** icon in the table's Actions column. In the **Edit Table Information** window, enter a **Table Description** and a **Column Description** for each column, then click **Save**. The window shows your progress (for example, "3 10 columns configured").

編輯表格資訊

📌 為什麼需要填寫表格與欄位說明？

AI 會根據您提供的說明來理解資料結構與業務語意，進而產生正確的查詢。說明越完整，AI 的查詢準確度越高；若缺少說明，AI 可能無法正確理解欄位含義，導致查詢結果不符預期。

資料表: table_docslinedemoorderscsv_8a7da70ef9

來源檔案: docs-line-demo-orders.csv

表格描述

例如：2024年度銷售報表，包含訂單金額和客戶資訊

說明這張表儲存什麼資料、用途是什麼

欄位描述

已設定 0 / 4 個欄位

欄位名稱	類型	描述
amt	NUMERIC(19,4)	輸入欄位描述...
order_id	NUMERIC(19,4)	輸入欄位描述...
reg	sqlalchemy.sql.sqltypes.Text	輸入欄位描述...
status	sqlalchemy.sql.sqltypes.Text	輸入欄位描述...

取消

 儲存

Edit Table Information: Enter table and column descriptions

External Database: In the **Table Structure Description** section below the **Basic Information** tab, click **Add Table**, enter the **Table Name** and **Column and Purpose Description**, then click **Save**.

Writing Tips

Good column descriptions can significantly improve the accuracy of AI queries:

Column Name	Less Helpful Description	Better Description
amt	Amount	Total order amount (NTD), including tax and shipping
cust_lvl	Level	Customer level: A for VIP customers spending over 1 million per year, B for annual spending of 100,000–1 million, C for others
reg	Region	Customer's geographic region; possible values: north, central, south, east, offshore islands

Manage Existing Databases

Edit a Database

In the database list, click the **Edit** icon in the Actions column to open the settings page.

The settings page contains these tabs:

Tab	Description	Applies To
Basic Information	Edit the name, description, and enabled status; for external databases, also change the connection string, specified tables, and table structure descriptions	All databases
Table Management	Upload files and manage tables and column descriptions	MaiAgent Database only
Linked AI Assistants	Specify which AI assistants can use this database	All databases
Role Permissions	Configure access permissions for roles	All databases

For security, passwords in external database connection strings are masked. To change one, click [Change](#) and enter the complete new connection string.

Enable Disable

In the database list, use the **Enable** switch to change the status quickly. When disabled, AI assistants temporarily cannot query the database, but its settings and data are retained.

Delete a Database

Deleting a database cannot be undone. MaiAgent Database: Also deletes all tables created from uploaded files External Database: Removes only the connection settings in MaiAgent; the data in the original database is unaffected

Text to SQL with MaiAgent Database

To have the AI Assistant help you analyze spreadsheet data such as Excel and CSV files, simply upload the files to the MaiAgent Database. The AI Assistant can then query the data using natural language and produce statistical analysis results.

For an introduction to the Text to SQL concept, see: [Text to SQL Feature](#)

Step 1: Create a MaiAgent Database

Navigate to "AI Features" > "Database" from the left sidebar

Click "Add Database"

Select "MaiAgent Database"

Enter a database name (e.g., "2024 Annual Sales Data") and click Create

Select MaiAgent Database and enter a name

For detailed creation steps, see: [Create and Configure Database](#)

Step 2: Upload Spreadsheet Files

After creation, go to the database settings page:

Switch to the "Table Management" tab

Click "Upload Table File"

Drag and drop or select your spreadsheet file

Upload files in the Table Management tab

You can download the sample file (a food sales file with 100 items in .xlsx format) to test and experience the AI Assistant's data analysis capabilities.

After the upload is complete, wait for the processing status to show "Success", which indicates the data table has been created successfully.

Supported formats: .csv, .xlsx, .xls, .json, .jsonl. Each worksheet in an Excel file will be created as a separate data table.

Table Format Notes

- [x] Each worksheet (Sheet) must contain only one table
- [x] The first row must be field names
- [x] It is recommended to annotate data formats after field names, such as: `Price(int)`, `Date(datetime)`
- [x] Data types within each field should be consistent
- [x] If there are special formats (e.g., currency, percentages), standardize the formatting before uploading

To improve AI query accuracy, it is recommended to add descriptions to data tables and fields. See: [Create and Configure Database — Edit Field Descriptions](#)

Step 3: Link AI Assistant

Link the database to your AI Assistant so it can query the data:

Switch to the "[Linked AI Assistants](#)" tab

Select the AI Assistant to link from the left side and move it to the right

Click "[Save](#)"

Link the database to the AI Assistant

Ensure the AI Assistant's Response Mode is set to Agent Mode, otherwise the Text to SQL feature cannot be used. For detailed Response Mode settings, see: [Create AI Assistant](#)

Step 4: Chat with the AI Assistant

Once the above steps are complete, you can go to the AI Assistant's conversation page and describe your needs directly using natural language.

For the AI Assistant conversation interface, see: [Choose an Integration Platform](#) to select the most suitable conversation platform for your needs.

Data Analysis

The Text to SQL tool can help you analyze data in spreadsheets. For example: "Find the best-selling dairy product from last year"

When you make a request, the AI Assistant will automatically invoke the Text-to-SQL tool.

This tool acts like a translator, converting your natural language into SQL syntax that the computer can understand, allowing the AI Assistant to extract data from the database.

The AI Assistant automatically adds conditional logic, sorting criteria, and other query constraints to convert your request into a more complete query command.

AI Assistant's Query Reasoning: Find the best-selling dairy product from last year, sorted by sales quantity in descending order. It automatically adds descending order conditions to better match your needs.

AI Assistant's Response (click the tool response to view):

Result

The AI Assistant found all sales data for "Dairy Products" along with other field data for those items. Each row represents a data record, including: Product ID, Product Name, Product Category, Sales Amount, Sales Quantity, etc.

Based on this data, the AI Assistant determined that the best-selling dairy product is "Cheese", with a sales quantity of 110 and sales amount of 40,150 TWD.

Report Creation (Canvas Mode)

The Text to SQL tool can also help you create polished reports. This feature requires enabling Canvas Mode:

Go to "AI Assistant Settings Page > Response Mode Settings" and find **Agent Mode**

Change Agent Mode from Standard Mode to **Canvas Mode**

After saving the settings, you can chat with the AI Assistant. For example: "Please generate a visualized revenue report with statistics"

AI Assistant's Query Reasoning: Calculate revenue statistics for each product in the food company, including total revenue, average revenue, revenue standard deviation, revenue distribution ranges, revenue share by category, and other statistical metrics. It automatically generates the calculation results needed for the report to better match your needs.

AI Assistant's Response (click the tool response to view):

```
[('Category Revenue Share - Staples', '10.72%'), ('Category Revenue Share - Dairy', '11.97%'), ('Category Revenue Share - Frozen', '9.06%'), ('Category Revenue Share - Canned', '10.25%'), ('Category Revenue Share - Meat', '13.23%'), ('Category Revenue Share - Fruits & Vegetables', '13.34%'), ('Category Revenue Share - Condiments', '4.51%'), ('Category Revenue Share - Snacks', '14.53%'), ('Category Revenue Share - Beverages', '12.40%'), ('Total Products', '100'), ('Average Revenue', '19546.06'), ('Minimum Revenue', '1400'), ('Maximum Revenue', '63364'), ('Revenue Std Dev', '15736.83'), ('Total Revenue', '1954606')]
```

Result

The AI Assistant received the automatically computed results for all required statistical items from the tool.

The AI Assistant used this data as the basis for visualization and created an interactive report interface using Canvas.

Click the "Use Canvas" box to view the content

The report display is shown below. You can:

Toggle between viewing the source code or the rendered view

Switch report content by statistical category (this varies depending on each AI Assistant's output)

When switching to other categories, you can view the category revenue share pie chart and distribution analysis bar chart:

Open Sandbox

Additional Tips

Data quality matters: Ensure your spreadsheet data is clean and accurate, as this directly affects the accuracy of the AI Assistant's analysis results. Data you do not want the AI to access must be deleted: Hidden data in spreadsheets can still be parsed and provided to the AI Assistant. Therefore, data you do not want exposed cannot simply be hidden — it must be deleted.

Try different questions: By asking questions in different ways, you can uncover more valuable insights from your data.

Make good use of Canvas Mode: Canvas Mode allows you to easily create various visualized reports for a more intuitive presentation of data analysis results.

Make good use of field descriptions: Adding descriptions to data table fields can significantly improve AI query accuracy.

Link AI Assistants & Group Permissions

After creating a database and configuring the data tables, you need to **link the database to an AI Assistant** so the AI Assistant can use the Text to SQL feature to query data.

Link AI Assistants

Steps

Go to the database settings page and switch to the "**Link AI Assistants**" tab

The left side of the page shows available AI Assistants, and the right side shows linked AI Assistants

Select the AI Assistants you want to link from the left side and click the arrow button to move them to the right side

Click "**Save**" when finished

Link AI Assistants tab: available assistants on the left, linked assistants on the right

You can use the search field to quickly find a specific AI Assistant. When there are many AI Assistants, the list is displayed with pagination.

Make sure the AI Assistant's response mode is switched to Agent Mode, otherwise the Text to SQL feature cannot be used. For details on response modes, see: [Create AI Assistant](#)

Multi-Database Query

An AI Assistant can be linked to multiple databases. When a user asks a question, the AI Assistant automatically determines which database to query based on the question content:

```
User: "What were the sales last month?"  
→ AI Assistant automatically queries the "Sales Database"  
  
User: "How many employees are currently in the Marketing department?"  
→ AI Assistant automatically queries the "HR Database"
```

To help the AI Assistant accurately distinguish between different databases, give each database a name that clearly describes its purpose, and provide detailed descriptions and field descriptions.

Group Permission Management

Group permissions let you control database access scope for different teams in your organization, ensuring each team can only see databases relevant to them.

Configure Group Permissions

Go to the database settings page and switch to the "[Group Permissions](#)" tab

Use the transfer component to move the groups you want to authorize from the left side to the right side

Click "[Save](#)" when finished

Group permissions and "Link AI Assistants" are independent settings. Even if a database is linked to a specific AI Assistant, if the user's group does not have access to that database, the user still cannot query it.

Permission Levels

Database access is determined by the following conditions together:

Can a user query the database through an AI Assistant?

- ✓ Database is enabled
 - └─ ✓ Database is linked to the AI Assistant
 - └─ ✓ User's group has access to the database
 - └─ ✓ Query allowed

Database owner (creator) can access all databases they created, not restricted by group permissions

Non-owners need group permissions to access databases

Tools

Tools Feature Overview

What Are Tools?

Tools are like **plugins** or **extensions** for an AI assistant, enabling it to do more than just chat. For example, if an AI assistant has a **"Check Weather"** tool, it can tell you today's temperature; if it has a **"Play Music"** tool, it can play music directly for you.

By letting users define a set of "tools" that the AI assistant can use, the AI assistant is able to:

Understand complex user requests.

Automatically determine when a specific tool needs to be used.

Automatically generate the parameters required to call that tool.

This enables the AI assistant to go beyond generating text responses and actually perform a variety of tasks, such as:

Querying real-time information: Retrieve the latest stock prices, weather forecasts, flight statuses, etc. from databases or APIs.

Executing external operations: Call booking system APIs, control smart home devices, send emails or messages.

Processing files: Read, write, or analyze local or cloud documents.

Integrating with other software: Operate CRM systems, project management tools, or other enterprise applications.

How Tools Work

A basic tool invocation workflow includes the following steps:

Define tools:

Users must first define the relevant parameters for the tools.

Configure which tools the AI assistant can use.

Each tool must include:

A clear **Name**.

An easy-to-understand **Description** that explains the tool's purpose.

Detailed **Parameter specifications**, including each parameter's name, data type, whether it's required, etc.

User asks a question:

The user makes a request to the AI assistant in natural language.

Example: "Check tomorrow's weather in Taipei for me."

Model reasoning and tool selection:

The LLM inside the AI assistant analyzes the intent of the user's request.

The model determines whether a tool is needed and which tool from the available list to use.

Example: The model determines that weather information is needed and selects the tool named `get_weather`.

Generate tool call parameters:

The model generates a structured output (typically in JSON format) containing the tool name and its required parameters.

Example:

```
json { "name": "get_weather", "arguments": { "city": "Taipei", "date": "tomorrow" } }
```

5. Application executes the tool:

- * The AI assistant's backend application receives and parses the JSON instruction generated by the model.

- * The application executes the corresponding function or calls the external API based on the tool name and parameters in the instruction.

- * *Example:* The backend calls the weather query API, passing "Taipei" and "tomorrow" as parameters.

6. Return the result to the model:

The application returns the result of the tool execution (typically also in JSON format) back to the AI assistant's model.

Example:

```
json { "temperature": "25°C", "condition": "Sunny" }
```

7. Model generates the final response:

- * The model receives the tool execution result and incorporates it into the final natural language response.

- * *Example:* "Tomorrow's weather in Taipei is expected to be sunny with a temperature of about 25°C."

Key Advantages of Tools

Extend AI assistant capabilities: Break free from the limitation of only generating text, enabling the AI assistant to access real-time information and perform real-world tasks.

Improve reliability and accuracy: Through structured calls and responses, ensure task instructions are clear and precise, reducing the risk of model "hallucinations" or operational errors.

Enable complex automated workflows: Design AI assistants that can autonomously complete multi-step, cross-system tasks, dramatically improving efficiency (e.g., automatically planning a travel itinerary and booking flights and hotels).

More natural interaction experience: Users only need to describe their needs in natural language, and the AI assistant can understand and translate them into precise system operations.

Tool Types Supported by MaiAgent

The following major types are currently supported:

API Tools

The most commonly used type. Used to connect to and call external HTTP/HTTPS API services.

Common applications: Retrieving weather information, querying external databases, triggering webhooks, integrating with third-party services, etc.

Required configuration: API endpoint URL, HTTP method, request headers, parameter schema.

MCP Tools

Model Context Protocol (MCP) enables collaboration between servers, clients, and hosts through a standardized protocol.

Applicable scenarios: Enabling the AI assistant to call external tools for more complex and practical tasks.

Required configuration: MCP server URL, parameters, environment variables, etc.

Create an MCP Tool

What Is MCP?

MCP, or Model Context Protocol, is used to integrate multi-cloud platform services or execute local client applications.

Think of tool usage like electrical plugs — the plug must be connected to power before the service can be used. Traditionally, each LLM develops its own tool usage methods, like plugs of different standards that require multiple socket types. If you want both OpenAI and Claude to use Google Calendar services, developers need to build multiple scripts for different AIs.

When Google Calendar updates, developers may need to:

- Update 3 different integration versions simultaneously

- Maintain 3 separate sets of technical documentation

This leads to extended development timelines and excessive costs.

MCP Solution

MCP is a standardized protocol designed to solve this problem through:

- Standardized tool definition formats

- Unified communication protocols

- Consistent error handling mechanisms

These approaches simplify the development process.

With MCP, developing a tool requires only:

- Building an MCP Server (one-time development)

- Defining standardized tool specifications

- Implementing unified business logic

All AI platforms that support MCP can use it

Before and after MCP integration

MCP is fundamentally a protocol designed for **standardizing AI tool integration**, enabling development teams to "build once, use everywhere," significantly reducing the complexity and maintenance costs of the AI assistant tool ecosystem.

Quick MCP Tool Setup

1. Access the Tool Management Interface

From the left navigation panel, go to the "AI Features" section, then click "Tools." On the tool list page, click the "+ Add Tool" button in the upper right corner.

Click "+ Add Tool" to get started

2. Select the Tool Type

Select **MCP** as the tool type.

新增工具

* 工具類型

MCP

API

MCP

MCP 配置

* 指令或伺服器 URL

請輸入

參數 (以逗號分隔)

例如: param1, param2

* 環境變數 (JSON) ⓘ

n

取消 確認

3. Set the Display Name

Set a clear display name for the tool. In this example, set it to **Composio mcp for google calendar**.

編輯工具

工具類型

MCP

顯示名稱 ①

Composio mcp for google calendar

MCP 配置

指令或伺服器 URL

https://mcp.composio.dev/composio/server/23b54607-75be-46d3-93de-67bc2e2a82d7/mcp?include_composio_help

參數 (以逗號分隔)

key: param1, param2

環境變數 (JSON) ①

取消 確認

Purpose: This name is displayed on the platform interface for all users to see.

Recommendation: Choose a name that clearly describes the tool's main function for easy user understanding. There are no strict formatting requirements for this name.

4. Fill In the MCP Configuration

a. MCP Server URL

Purpose: MaiAgent currently accepts external MCP servers. By providing the MCP server's service URL, the AI assistant can call the MCP service to connect to external applications.

Format:

Enter the full URL (e.g., https://mcp.dev/maiagent/mcp_service).

Note: This field is required.

For instructions on obtaining an MCP URL, refer to [Technical Manual — Remote MCP Service Overview](#)

Paste your MCP server URL here, and the system will automatically retrieve the list of connected tools from that server:

編輯工具

工具類型

Composio mcp for google calendar

4 MCP 配置

指令或伺服器 URL

https://mcp.composio.dev/composio/server/23b54607-75be-46d3-93de-67bc2e2a82d7/mcp?include_composio_help

參數 (以逗號分隔)

例：param1, param2

環境變數 (JSON) ⓘ

{}

取消 確認

b. 🧩 MCP Command Arguments (mcp_args)

If you don't need to set specific environment variables, this field can be left empty.

Purpose: Define parameter names that need to be passed when executing MCP commands or calling MCP services. The content is automatically generated by the AI assistant.

Format: Use JSON array format, where each element is a string representing a parameter.

Example (JSON array):

```
[  
    "--user",  
    "admin",  
    "--config",  
    "/path/to/config.yaml"  
]
```

* **At runtime:** The AI assistant passes these parameters to the MCP tool in order

* If you enter a comma-separated string (e.g., arg1,arg2,arg3), the system will attempt to parse it as a parameter list. To avoid ambiguity, use JSON arrays.

編輯工具

取消 確認

Configure MCP command arguments

c. 🌱 MCP Environment Variables (mcp_env)

If you don't need to set specific environment variables, this field can be left empty.

Purpose: Set required environment variables for the MCP command execution environment.

Format: Must be a valid JSON object where keys are environment variable names and values are environment variable contents (strings).

Example:

```
json { "API_KEY": "{{SECRET_MCP_API_KEY}}", "REGION": "us-west-1", "DEBUG_MODE": "true" }
```

Configure MCP environment variables

5. Find "Allowed Tools (JSON Array)" and Click Refresh

Purpose: Specify which sub-tools the AI assistant is authorized to use under this MCP client. A single MCP client may provide multiple different features or sub-tools.

Auto-detect/Leave empty: If this field is left empty or not provided, the system will attempt to auto-detect all available sub-tools when first connecting to the MCP client, and allow all detected sub-tools by default. If you want to restrict the AI assistant to only specific sub-tools, explicitly list them here.

After clicking, the system automatically retrieves the tool content connected to that server and displays it in the list:

MCP-defined tool names

6. 📁 Save the Tool

After confirming all settings are correct, scroll to the bottom of the page and click the "Confirm" button. Your new tool is now created!

⚠ Important Reminders

Connection Testing

After creating the tool, test the MCP connection to ensure it works properly
Verify tool functionality in a test environment

Permission Management

Carefully select allowed tools to avoid authorizing unnecessary features
Regularly check tool usage status

Troubleshooting

If the connection fails, check whether the MCP server URL is correct
Confirm that environment variables and parameter formats meet the requirements

Customize Tool Message Display

When an AI assistant calls a tool, you can control how much execution information appears in the conversation and format the tool results for easier reading. These settings apply to API, MCP, and Function tools.

Members with permission to edit the tool can modify the display copy, display mode, and output rendering template. Members without edit permission can only view these settings.

Use Case

A customer service manager creates an API tool for looking up trial requests. She wants customer service agents to see the lookup progress without expanding all the technical details. On the tool's **Display Copy** tab, she selects **Compact** and configures the text displayed when execution finishes. When the assistant later calls the tool, customer service agents see a brief execution status instead of the tool's complete input and output.

Configure the Display

Open the Tool Editor

From the left menu, go to **AI Features** → **Tools**. Find the tool you want to configure in the tool list, then click the edit icon on the right.

Open the Display Copy Tab

In the **Edit Tool** window, select **Display Copy**.

Display copy and display mode settings for a tool

Select a Display Mode

Select a mode based on how much information conversation users need to see:

Mode	Effect in the conversation
Follow conversation platform settings	Uses the conversation platform's default display behavior. The current default is Full .
Full	Displays complete tool execution information.
Compact	Displays only concise execution information.
Hidden	Does not display the tool execution block.

Hidden only hides the tool execution block in the conversation; it does not disable the tool. To prevent the AI assistant from calling the tool, go to the AI assistant's Tools settings and remove the tool from its configuration.

Customize the Display Copy

In the **Display Copy** section, click **Add** and configure the text displayed while the tool is running and after it finishes. The copy can use `{{variable}}` to insert a top-level parameter from the tool input, such as `{{query}}`. If the variable cannot be found, an empty string is displayed.

Configure the Output Rendering Template

To format the content returned by the tool, click **Add** in the **Output Rendering Template** section. The template can use `{{output}}` to insert the complete tool result or `{{variable}}` to insert a top-level parameter from the tool input. If the variable cannot be found, an empty string is displayed. If the template is left blank, the raw JSON is displayed.

When finished, click **Confirm** to save.

Recommendations for Selecting a Mode

Select **Full** when users need to verify the tool results.

Select **Compact** and provide clear display copy when users only need to know that the system is processing the request.

Select **Hidden** when execution details should not appear in the conversation.

After completing the setup, assign the tool to a test AI assistant and send a test question. Confirm that the display copy and output template match the fields actually returned by the tool.

Contacts MCP Credential Setup

I. Feature Background

What Is the MCP Credential Feature?

The MCP credential feature is like "setting up a dedicated pass for each customer." When multiple customers need to use the same tool to query their own data, each person needs their own "key" (credential) to ensure they can only see their own data and not anyone else's.

Simple Analogy

Think of an apartment building — all residents use the same elevator (MCP tool), but each person must swipe their own access card (credential) to enter their own floor.

Why Is This Feature Needed?

Protect Customer Privacy — Each customer uses their own credentials, ensuring data is not mixed together

Individualized Service — Different customers can have different usage permissions

Easy Management — When a customer's credentials expire or need replacement, you only need to update that one customer's settings

Use Case Examples

Scenario 1: Personal Data Queries

Customer A and Customer B both need to query their own purchase records, but each has different account credentials

Scenario 2: Department Permission Management

Different departments use the same query tool but have different viewing permissions

Scenario 3: Tiered Service

VIP customers can query more detailed data, while regular customers can only query basic information

II. Feature Location & Preparation

Where to Find This Feature

Navigation Path

Contact Management → Click Edit Contact → Switch to the "MCP Credentials" tab

Important Reminder

You must first create and save the contact before you can configure MCP credentials (to ensure credentials are correctly bound to the contact)

Preparation Before Setup

Before starting the configuration, confirm the following:

MCP tools have already been created in the system (AI Features → Tools → MCP)

- 2. The contact to receive credentials has been created and saved
- 3. You have obtained the contact's credential information (usually provided by the customer or authorized personnel)

Permission Note

System administrators can flexibly assign "Tools" and "Contacts" feature permissions based on organizational needs.

III. Operating Instructions

3.1 View Available Tools

Steps

- Open the contact you want to edit
- Click the "MCP Credentials" tab at the top
- You will see a list of all configurable tools

Tool List Description

Each tool displays:

Tool Name (e.g., "Customer Database Query")

Tool Description (if available, shown in gray text below the name)

Edit Button (pencil icon on the right)

How to Identify Configuration Status

Already configured → A green "Configured" label appears to the right of the tool name

Not yet configured → No label appears to the right of the tool name

3.2 Add or Modify Credentials

Step 1: Open the Settings Area

Click the "Edit" button (pencil icon) to the right of the tool to expand the settings area

Step 2: Fill In Headers (Credential Information)

Paste the credential information in the text box using JSON format:

```
{"Authorization": "Bearer your-key-code-here"}
```

If you're unsure about the format, click the "**Format JSON**" button to auto-format

What Are Headers?

Headers are like "identification documents" that contain the contact's dedicated key. Just like you need to bring your ID when going to the bank, the system needs these Headers to confirm "who this person is."

What Is JSON?

JSON is a data format that looks like: {"field_name": "content"}. Don't worry — usually someone will provide this to you directly, and you just need to copy and paste it.

Step 3: Important Notes

Headers are **required** (marked with a red *)

The entered Headers will **replace** the tool's default settings

Important: Different MCP tools require different Headers formats. Make sure the credential format you received matches the tool's requirements

Step 4: Save or Cancel

Save Settings

After confirming everything is correct, click the **"Save"** button in the bottom right corner

The system will validate the format

After saving successfully:

The editing area will automatically collapse

A **green "Configured" label** will appear to the right of the tool name (only appears for the first time)

Cancel Editing

If you don't want to save, click "Cancel"

3.3 Reset Credentials (Clear Configured Credentials)

When Would You Use This?

When credentials are configured incorrectly, or when the credentials are no longer needed, you can reset them.

How to Operate

Click the tool's "Edit" button to expand the editing area

If the tool already has credentials configured (has a green "Configured" label), a red **"Reset Credentials"** button will appear in the bottom left corner

Click to confirm, and the credentials will be cleared

After clearing, the green "Configured" label to the right of the tool name will disappear

Important Reminder

Reset **cannot be undone**

It is recommended to copy and back up the Headers content before resetting

If you only need to modify the content, edit it directly — there's no need to reset

IV. Operation Examples

Example 1: Set Up Database Query Credentials for a Customer

Scenario

Customer A needs to query their own purchase records, and you have received a set of credential codes.

Headers Content

```
{
  "apikey": "eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9 ... ",
  "Authorization": "Bearer eyJhbGciOiJIUzI1NiIsInR5cCI6IkpXVCJ9 ... "
}
```

Steps

Find contact "Customer A" and click Edit

Switch to the "MCP Credentials" tab

Find the "Customer Database Query" tool and click the Edit button

Paste the credential codes

Click "Format JSON" to ensure proper formatting

Click Save

Example 2: Set Up Dedicated Query Credentials for a Department

Scenario

The sales department needs to access customer data but can only view basic information, not financial data.

Headers Content

```
{
  "X-API-Key": "dept_sales_abc123",
  "X-Department": "sales"
}
```

Field Descriptions

X-API-Key — The sales department's dedicated key

X-Department — Identifies this is being used by the sales department

Example 3: Set Up Credentials with Multiple Fields

Headers Content

```
{
  "Authorization": "Bearer token_xyz",
  "X-Client-ID": "client_12345",
  "Content-Type": "application/json"
}
```

Field Descriptions

- Authorization** — The main authentication key
- X-Client-ID** — Client ID number
- Content-Type** — Data format specification (usually fixed to this value)

V. Contact MCP vs. Tool MCP Differences

Feature Comparison Table

Comparison Item	Tool → MCP	Contact → MCP Credentials
What Is It	Creates the tool itself	Sets up dedicated credentials for individual contacts
Scope	Available system-wide	Only for a specific contact
Configuration	• Tool URL • Default credentials • Available functions	• Only this person's credentials • Overrides default credentials
When to Use	When connecting a new tool for the first time	When each customer needs different credentials
Who Can Operate	Anyone with permissions	Anyone with permissions
Where to Configure	Tool management page	Contact editing page
Common Uses	• Add a new query tool • Set up tool basics	• Each customer uses their own credentials • VIP customers have special permissions

Simple Analogy: Computer Lab

Imagine a school computer lab:

Tool MCP (Set up by authorized personnel)

Install software in the computer lab
Configure all computers to use the software
Determine which features the software has

Contact MCP Credentials

Create individual accounts for each student
Each student logs in with their own account
Different students can have different usage permissions

Practical Workflow

```
Step 1: Create MCP Tool (by personnel with tool creation permissions)
  ↓
Create "Customer Database Query" tool
- Set tool URL
- Set default credentials (if applicable)
  ↓
Step 2: Set up dedicated credentials for each contact (by personnel with
credential configuration permissions)
  ↓
Customer A: Configure A's dedicated credentials
Customer B: Configure B's dedicated credentials
Customer C: Configure C's dedicated credentials
  ↓
Result: Everyone uses the same tool but with their own credentials
```

Permission Flexibility

System administrators can determine who can create tools and who can configure credentials based on organizational needs. These can be the same people or managed separately.

Key Takeaways

Tool MCP — You need the "tool" first before it can be used

Contact MCP Credentials — Then give each person their "key"

VI. FAQ

Q1: Why can't I see the "MCP Credentials" tab?

Possible Reasons

You are on the "Add Contact" page (you need to save the contact first, then re-enter edit mode to see it)

No MCP tools have been created in the system yet

The contact data hasn't been saved yet

Solutions

Fill in and save the contact's basic information first

Confirm that MCP tools exist in the system (check with authorized personnel)

Re-enter edit mode

Q2: What should I do if the Headers format is incorrect?

Common Error Examples

✗ Wrong: `{'key': 'value'}` (used single quotes)

✗ Wrong: `{key: value}` (no quotes)

✗ Wrong: `{"key": "value",}` (trailing comma)

✓ Correct: `{"key": "value"}`

Solutions

Click the "Format JSON" button — the system will auto-check

If there's still an issue, copy the credentials again

Or ask the credential provider to re-confirm the format

Q3: How do I know what to fill in?

How to Obtain Credentials

Ask the customer to provide their credential information

Ask the responsible personnel to provide or help create them

Ask the colleague responsible for the tool

Refer to other successfully configured contacts (but don't copy directly!)

⚠ Don't fill in random values

Credentials have specific formats and content. Entering incorrect values will prevent the tool from working and may cause data errors.

Q4: Why don't I see the "Configured" label?

Display Conditions

Only tools that have already been configured with credentials show the green label

When configuring for the first time, the label won't appear until after saving successfully

The label appears only after a successful save

No labels on any tools in the list?

This means the contact hasn't had any MCP credentials configured yet — this is normal.

Q5: Can't find the "Reset Credentials" button?

Display Conditions (all must be met)

The tool already has credentials configured (green "Configured" label appears to the right of the tool name)

You have clicked the "Edit" button to expand the editing area

Button Location

After expanding the editing area, the red "Reset Credentials" button is in the bottom left corner; the "Cancel" and "Save" buttons are in the bottom right corner.

Tool doesn't have credentials configured yet?

The "Reset Credentials" button won't appear because there are no credentials to reset. The bottom left corner will be empty.

Q6: What happens when I click "Reset Credentials"?

What Happens

The contact's dedicated credentials will be cleared

The green "Configured" label to the right of the tool name will disappear

If the tool has default credentials, those will be used instead (but usually there are none)

 **Deletion cannot be undone**

Recommended Approach

Copy and back up the Headers content first

Make sure you really want to delete

If you only need to modify the content, use "Edit" instead

Q7: Can multiple contacts use the same set of credentials?

Technically, yes

The system won't prevent you from copying the same credentials to different people

But it's not recommended

You won't know who is using it

Data may get mixed together

When something goes wrong, you won't know whose issue it is

Correct Approach

Each contact uses their own credentials

Keep data clearly separated

Easier to track and manage

Q8: The tool list is empty, showing "No available tools"?

Possible Reasons

No MCP tools have been created in the system yet

All tools are "global" type (global tools don't require individual credential configuration)

Solutions

Ask personnel with tool creation permissions to confirm whether MCP tools have been created

Confirm that the tool type settings are correct

If everything looks normal but you still can't see any tools, contact technical support

Appendix: Operation Checklist

Pre-Setup Confirmation

- ☐ The contact has been created and saved
- ☐ MCP tools are available in the system
- ☐ Credential information has been obtained (from the customer or responsible personnel)
- ☐ Credential format has been verified as correct

During Setup Confirmation

- ☐ Headers format is correct (use the Format button to check)
- ☐ All required fields are filled in
- ☐ No extraneous or incorrect content
- ☐ No error messages appear after formatting

Post-Setup Confirmation

- ☐ Green "Configured" label appears to the right of the tool name
- ☐ Tool has been tested and works correctly
- ☐ Setup information has been recorded (date, contact, tool name)
- ☐ Relevant personnel have been notified of the completed setup, if needed

Create an API Tool

You can use MaiAgent's [Tool Builder AI Assistant](#) to help you create an API tool.

API tools integrate external services and automate workflows.

What is an API?

An **API (Application Programming Interface)** is a bridge that lets different software systems communicate. Think of it as a **waiter in the software world**: it carries information and requests between programs.

Imagine dining at a restaurant:

- You:** the customer ordering food (the application)
- The kitchen:** where the food is prepared (the service provider)
- The waiter:** carries messages between you and the kitchen (the **API**)

You do not need to enter the kitchen. Tell the waiter what you want; the waiter passes your request to the kitchen and brings the finished meal back to you.

Diagram of the API workflow

API tools can automate standard workflows, set specific response formats, and retrieve information from your systems. For example:

Automated ecommerce customer service

Customer asks about an order → API checks order status → Automatically replies with delivery progress

Marketing campaign management

New product launches → Automatically updates the website → Sends an email campaign → Promotes on social media

Online learning platform:

Student asks about course progress → API checks learning records → Automatically replies with completion percentage and next class time

With API tools, an AI assistant can go beyond conversation and carry out business processes, improving efficiency and automation.

Quickly Create an API Tool

1. Open Tool Management

In the left navigation bar, open **AI Features**, then click **Tools**. On the tool list page, click **+ Add Tool** in the upper right.

Click “+ Add Tool” to begin

2. Select a Tool Type

Select API as the tool type.

編輯工具

google calendar

+ 工具名稱 ⓘ

google_calendar_retriever

+ 描述 ⓘ

請輸入

API 配置

+ API URI ⓘ

https://api.example.com/endpoint

HTTP 方法

GET

取消 確認

Purpose: This name appears in the platform interface for all users.

Recommendation: Choose a name that clearly describes the tool's main function. There are no strict formatting requirements.

4. Set the Tool Name

Next, fill in the **Tool Name** field.

Purpose: This unique identifier is used internally when an AI assistant calls and identifies the tool.

Naming rules (important):

Use English characters.

The name may contain only:

Lowercase letters (a-z)

Uppercase letters (A-Z)

Digits (0-9)

Underscores (_)

Hyphens (-)

Examples: `get_weather_forecast`, `database-query-tool`

The example below uses `google_calendar_retriever`.

Define the API tool name

5. Write a Tool Description

In the `Tool Description` field, provide a clear, detailed explanation of the tool.

Why it matters: A good description helps the AI assistant understand:

What the tool does and why it exists.

When to use the tool.

How to interpret its output.

What to include: Explain what the tool does, what it accepts and returns, and any usage considerations.

6. Configure API Details

a. 🔗 API URL

Enter the full URL of the target API endpoint (including `http://` or `https://`).

Example: <https://api.opencalendar.org/data/2.5>

編輯工具

6

API URL ①

https://api.opencalendar.org/data/2.5

HTTP 方法

GET

標題 (JSON) ①

{ \"Content-type\": \"application/json\" }

參數結構 (JSON Schema) ①

{ \"type\": \"object\", \"properties\": { } }

取消 確認

b. HTTP Method

Select the HTTP method required by the API service from the dropdown menu:

GET : Usually retrieves resources.

POST : Usually creates resources or submits data.

PUT : Usually replaces or updates a resource in full.

DELETE : Usually deletes resources.

c. 📄 Headers

Headers are like the **envelope** of a letter: they provide important information before the recipient reads the contents. **Without the correct headers, an API request might fail authentication or the recipient might be unable to parse the data.**

Common uses:

Authentication (**Authorization** , **X-API-Key**)

Specifying the content type (**Content-Type**)

Specifying the accepted response format (**Accept**)

To add headers:

Click **+ Add Header** to define HTTP headers sent with the request.

Format: A valid JSON object. Each key is a header name, and each value is the header content (a string).

Example:

```
{
  "Content-Type": "application/json; charset=utf-8",
  "Authorization": "Bearer {{SECRET_API_TOKEN}}",
  "Accept": "application/vnd.github.v3+json"
}
```

編輯工具

+ API URL ①

Set the required HTTP request headers

d. 🔍 Query Parameters (Query Params)

Query parameters are strings appended after the question mark in a URL (for example, `?format=json&limit=10`). They are sent with every call. Use them for fixed search conditions or API keys that must be passed in the query string.

Click **Available Context Variables** to expand the currently supported variables (contact ID, conversation ID, inbox ID, and more).

Format: A valid JSON object. Each key is a parameter name, and each value is the parameter content (a string).

Values may be fixed text or use `{{parameter_name}}` to reference a parameter declared in the Parameters Schema and supplied by the AI assistant at call time. This lets you combine a fixed prefix with a user-provided value through configuration. See [Reference AI Assistant Parameters in Query Parameters](#) below.

Example:

```
{
  "$format": "json",
  "$filter": "ProductName eq '{{product_name}}'"
}
```

Query Parameters field and Available Context Variables list

e. Parameters Schema

Think of the Parameters Schema as an order form: it tells the AI assistant what data it can request from the API and how to request it.

Core setting: Define which parameters the AI assistant can or must provide when calling this tool (the content passed to the system for processing), and their formats.

Format: Use standard **JSON Schema**.

Key elements:

`type: "object"` : Indicates that the parameters form an object.

`properties` : Defines the object for each parameter.

Parameter name (for example, `"search"`): The corresponding object contains the parameter's details.

`type` : The parameter's data type (`string` , `integer` , `number` , `boolean` , `array` , `object`).

`description` : Explains the parameter to the AI assistant.

`default` (optional): The parameter's default value.

`enum` (optional): Lists the allowed values if the parameter has a fixed set of options.

`required` : An array containing the names of all **required** parameters.

Example (video search tool):

```
{
  "type": "object",
  "properties": {
    "limit": {
      "type": "integer",
      "minimum": 1,
      "description": "Maximum number of results to return"
    },
    "fields": {
      "type": "string",
      "description": "Comma-separated list of fields"
    },
    "search": {
      "type": "string",
      "description": "Search keyword"
    }
  },
  "required": ["search"]
}
```

編輯工具

取消 確認

Use JSON Schema to define API parameters precisely

f. Path Parameters and Parameter Locations

Use `{parameter_name}` in the API URL to mark variable path segments, such as `/users/{userId}/orders/{orderId}`. To substitute values supplied by the AI assistant into the URL, define parameters with matching names in the Parameters Schema and set their location to **Path**. Before sending the request, the system URL-encodes each value. For example, `A/B 01` becomes `A%2FB%2001`, so slashes or spaces in the value do not change the URL structure.

Use case: A customer service manager wants an AI assistant to look up individual orders in the company's order API using a customer ID and order ID. She creates an API tool, sets both IDs as path parameters, and assigns the tool to an AI assistant. A colleague enters “Look up order order-25 for customer customer-01” in the conversation. The assistant places both IDs in the correct positions in the URL and sends the request. If the order ID is missing, the tool reports the missing value without sending an incomplete request.

Set an API URL with Path Parameters

Add a tool as described in “Quickly Create an API Tool” above. To practice, use the public httpbin response service and set the **API URL** to:

```
https://httpbin.org/anything/users/{userId}/orders/{orderId}
```

You can put multiple path parameters in one URL. After you enter it, **Detected Path Parameters** appears below the field and lists `userId, orderId`. If these names have not yet been defined in the Parameters Schema, a red **Define in Parameters Schema** message also appears.

Declare Matching Parameters in the Parameters Schema

Enter this in **Parameters Schema (JSON Schema)**:

```
{
  "type": "object",
  "properties": {
    "userId": { "type": "string", "description": "Customer ID" },
    "orderId": { "type": "string", "description": "Order ID" }
  },
  "required": ["userId", "orderId"]
}
```

Parameter names must match those inside the URL braces exactly, including case. **required** tells the AI assistant to provide both values on every call.

After you enter the schema, each parameter appears below it with a location menu set to **Default**. At this point, a red message appears below the API URL: **The following parameters are not located in “Path” ; placeholders in the URL will not be replaced**. Complete the next step to resolve it.

A red warning appears below the API URL while parameter locations are still Default

Set the Parameter Location to “Path”

Below the Parameters Schema, change the location menus for both `userId` and `orderId` to `Path`.

Choose a location for each parameter from the menu

The system automatically adds `"location": "path"` to the Parameters Schema, and the red warning below the API URL disappears. Check the settings, then click **Confirm** to save the tool.

Choosing Path also writes the location setting into the Parameters Schema

Parameters left at **Default** are not substituted into the URL. Even if the AI assistant supplies a value, {userId} remains unresolved; the tool reports an error and does not send the request. Set every parameter used in the URL to **Path**.

Assign the Tool to an AI Assistant and Test It

Follow [Configure Tools for an AI Assistant](#) to add the tool to an AI assistant in Agent mode. Then open [Agent Marketplace](#) from the left navigation bar, switch to **Created by Organization**, select the assistant, and enter “Look up order order-25 for customer customer-01” . After the assistant calls the tool, httpbin returns the request URL it received: <https://httpbin.org/anything/users/customer-01/orders/order-25>.

The AI assistant inserts both IDs into the URL before sending the query

To see the actual URL sent on each call, open **AgentOps** → **Tool Execution Records** from the left navigation bar. Click the eye icon in the record's Actions column to open **Details**, then find **Request URL** under **Request Information**. The following image shows a call with a slash and space in the customer ID (**A/B 01**); the value has been URL-encoded.

The Request URL in the execution record shows encoded path parameters

After practicing, replace the public example URL with your company's order API URL.

Parameter Location Options

You can set a location for each parameter in the Parameters Schema to control where its value is placed in the request:

Location	Description
Default	Keeps the existing behavior: GET puts the value in the query string; POST, PUT, and PATCH put it in the body. DELETE does not include it automatically, so select a location explicitly when you need to pass a value.
Path	Substitutes the value for the matching <code>{parameter_name}</code> in the API URL.
Query	Appends it to the query string after the URL's question mark.
Body	Places it in the JSON body.
Header	Sends it as an HTTP header using the parameter name. If “Headers (JSON)” already defines a header with the same name (case-insensitive), the configured header takes precedence.

Existing tools without a configured location retain their current behavior.

Requests Are Not Sent When a Path Parameter Is Missing

If any path parameter in the URL has no value on a call—because the AI assistant did not supply it, it is empty, or its location is not **Path**—the tool stops and reports “Path parameter {orderId} has no value in this call.” It does not send a URL containing `{orderId}`. The AI assistant explains the failure in the conversation. In **Tool Execution Records**, the record has a failed status, **Request Information** has no request content, and **Error Message** identifies the missing parameter.

When a path parameter is missing, the tool records the error without sending a request

URL Syntax Rules

Path parameter names may contain only letters, digits, and underscores, and cannot start with a digit. For example, `{order_id}` is valid; names such as `{order-id}` cannot be saved.

Put `{parameter_name}` in the path portion of the URL. For a value in the query string, set its location to **Query** or reference it as `{{parameter_name}}` in **Query Parameters**.

The API URL cannot use double braces like `{{variable}}`. Saving it shows an **Error**: “Path parameters must use {identifier} syntax.” In an API tool, use `{{parameter_name}}` in “Headers (JSON)” and “Query Parameters (JSON)” .

An API URL with double braces cannot be saved

A custom action in Google Style REST can retain its colon suffix, such as this Google Weather query:

```
https://weather.googleapis.com/v1/currentConditions:lookup
```

7. Save the Tool

Check all settings, scroll to the bottom of the page, and click **Confirm**. Your new tool is ready!

Reference AI Assistant Parameters in Query Parameters

Many third-party APIs build a query condition as a single string containing fixed syntax and a user-provided value, such as the OData-style `$filter=ProductName eq 'Chai'` or a search API's `q=` parameter. These APIs need the value embedded in a fixed string rather than passed as a separate parameter.

Put `{{parameter_name}}` in a Query Parameter value. When the AI assistant calls the tool, MaiAgent substitutes the value of the matching parameter in the Parameters Schema before sending the request. The person configuring the tool writes the fixed structure; the AI assistant supplies the value, so the model does not need to determine the query syntax.

Use Case

A purchasing department wants its internal AI assistant to answer “What are the current unit price and stock level of this product?” using an OData query service from the company's product catalog. Previously, this kind of query required separate code for each API. Now a purchasing specialist can create

one API tool, set the query condition to `ProductName eq '{{product_name}}'`, and assign the tool to an AI assistant. When a colleague asks “What is the unit price and stock level of Chai?”, the assistant inserts `Chai` into the query condition, calls the API, and replies with the product name, unit price, and stock level.

Setup Steps

The following example uses the public Northwind demo data service (OData):

Create a Tool and Enter Basic Information

Follow “Quickly Create an API Tool” above to add an API tool. Enter a display name (such as `Product Price Lookup`), the tool name `product_price_lookup`, a description, and a prompt. Set the `API URL` to:

```
https://services.odata.org/V4/Northwind/Northwind.svc/Products
```

Leave the `HTTP Method` as `GET`.

Declare the Parameter Supplied by the AI Assistant

Declare `product_name` in `Parameters Schema (JSON Schema)` and use `description` to tell the AI assistant what to provide:

```
{
  "type": "object",
  "properties": {
    "product_name": {
      "type": "string",
      "description": "Full English product name, such as Chai"
    }
  },
  "required": ["product_name"]
}
```

Reference the Parameter in a Query Parameter Value

Enter the fixed query structure in `Query Parameters (JSON)` and use `{{product_name}}` in a value to reference the parameter you declared:

```
{
  "$format": "json",
  "$select": "ProductID,ProductName,UnitPrice,UnitsInStock",
  "$filter": "ProductName eq '{{product_name}}'"
}
```

Click **Confirm** to save the tool.

Assign the Tool to an AI Assistant and Test It

Follow [Configure Tools for an AI Assistant](#) to add the tool to an AI assistant in Agent mode and save it. Then open **Agent Marketplace** from the left navigation bar, switch to **Created by Organization**, select the assistant, and start a conversation. Enter “What are the unit price and stock level of Chai?” The AI assistant displays “Tool used” and replies with Chai's unit price and stock level.

The AI assistant inserts the user-provided product name into the query condition before calling the API

Substitution Rules

Rule	Description
Variable names must match the parameter schema	<code>{{product_name}}</code> corresponds to a property name under <code>properties</code> in the parameter schema. Case must match exactly.
Only values are substituted	The template applies only to Query parameter values; keys remain unchanged and are not substituted.
Values are inserted as literal text	Parameter values are always inserted as literal text, with no numeric conversion. For example, the leading zero in company registration number <code>04595257</code> is preserved.
A missing value stops the call	If the AI assistant does not provide the parameter for this call (or the value is empty), the tool stops with an error identifying the missing parameter. It does not send <code>{{product_name}}</code> literally.
Context variables take precedence	If a parameter name matches a context variable such as <code>contact_id</code> or <code>conversation_id</code> , the context variable's value is always used. A value provided by the AI assistant cannot override it.
Referenced parameters are still sent separately	A parameter referenced by a template is also sent as a separate query parameter as usual (for example, <code>product_name=Chai</code> is sent too). Most APIs ignore the extra parameter.
Parameter names are preserved exactly	Query parameter keys containing underscores or uppercase letters, such as <code>Business_Accounting_NO</code> , are preserved without being rewritten by the system.

Values in **Headers (JSON)** also support `{{parameter_name}}` references to parameters in the parameter schema. The same rules as for Query parameters apply.

Existing tool settings without `{{ }}` are unaffected. If the system previously rewrote a Query parameter name in an older tool (for example, from `Business_Accounting_NO` to `business__accounting_no`), reopen the tool, restore the correct name, and save it. When you reopen the editor, Query parameter values appear masked as `;` saving directly does not discard their original values.

Important Notes

Connection testing

After creating a tool, test that the API works properly.

You can verify the tool with an API testing service such as:

POSTMAN

Your organization's own API request testing platform

Permission management

Regularly review tool usage and access permissions.

Built-in AI Image Generation Tool

Feature Overview

MaiAgent includes three AI image generation tools. They can create new images or edit existing ones using reference images. Select them in your AI agent's tool settings to start generating images.

On the AI agent settings page, click **Select Tools** under **Tools**. Under **Built-in Tools**, select any of these image generation tools:

Gemini 3 Pro Image

Gemini 3.1 Flash Image

GPT Image 2 image generation tool

Image generation tools in the Select Tools dialog

See [Configure tools for an AI agent](#).

🥘 Tool Comparison

Tool	Key features	Best for
Gemini 3 Pro Image	Context understanding, Chinese prompts, reference images, conversational editing	Creative work requiring context understanding or Chinese prompts
Gemini 3.1 Flash Image	Fast generation, Chinese prompts, reference images, multi-step editing instructions	Rapid iteration and brainstorming
GPT Image 2	Professional quality, iterative refinement, reference images, transparent backgrounds	Brand design and professional use

★ Generation Example

GPT Image 2: Professional Design Example

Prompt: "Draw a minimalist coffee cup logo with a transparent background, 1024x1024"

Coffee cup logo generated by GPT Image 2 (transparent background)

Highlights: Transparent background, refined lines, and suitable for brand use

📝 How to Use the Tools and Best Practices

Basic Prompt Examples

Use case	Example prompt	Recommended tool
Everyday creation	Draw a cute puppy	Gemini 3 Pro Image
Professional design	Design a modern minimalist logo with a transparent background	GPT Image 2
Rapid prototyping	Quickly generate a concept image for a website home page	Gemini 3.1 Flash Image

Multi-round Refinement (GPT Image 2)

```
Round 1: "Design a logo for a coffee shop"
Round 2: "Change the color to dark brown"
Round 3: "Add some steam"
Round 4: "Make the overall design more minimalist"
```

Edit Using a Reference Image

Gemini 3 Pro Image, Gemini 3.1 Flash Image, and GPT Image 2 all support editing with reference images. Upload the image you want to change in the conversation and describe only the changes you want. Unmentioned parts will remain as unchanged as possible:

```
"Use this image as a reference and change the background to a beach scene"
"Keep the person unchanged and only change the clothing color"
"Add some flowers to this scene"
```

If the AI agent says it cannot access a previously generated image, upload that image again in the conversation before requesting changes.

🎯 Practical Use Cases

Use Case 1: Social Media Content

Need: Create an image for an Instagram post

Recommended: Gemini 3 Pro Image

Example prompt: `Create a cozy cafe scene for an IG post`

Use Case 2: Corporate Brand Design

Need: Design a company logo and brand assets

Recommended: GPT Image 2

Example prompt: `Design a minimalist, modern logo for a technology company with a transparent background`

Use Case 3: Brainstorming and Prototyping

Need: Quickly visualize ideas and refine them iteratively

Recommended: Gemini 3.1 Flash Image

Example prompt: `Concept art for a mobile app interface design`

? Frequently Asked Questions

Image Quality

Q: How can I get the highest-quality images?

A: Use GPT Image 2 or Gemini 3 Pro Image and provide a detailed description:

- ✓ Specify the style (for example, "professional photography")
- ✓ Describe the scene in detail (lighting, angle, atmosphere)
- ✓ State your quality requirements (for example, "high resolution" or "commercial quality")

Q: Why doesn't the generated image match my expectations?

A: Try improving your prompt:

- 🎯 Use concrete details instead of abstract descriptions
- 🎨 Specify the artistic style
- 📐 Describe the composition and viewing angle
- 🌈 Describe the colors and lighting

Features

Q: How do I generate an image with a transparent background?

A: Use GPT Image 2 and explicitly request a transparent background:

```
Design a logo with a transparent background
Create an icon with a transparent background
```

Q: Can I edit an image I have already generated?

A: Yes. Gemini 3 Pro Image, Gemini 3.1 Flash Image, and GPT Image 2 all support reference image editing. Upload the image you want to change, then describe the change:

```
Use this image as a reference and change the sky to sunset colors
Keep the composition unchanged and only change the person's clothing
```

Gemini 3 Image Generation Tool

Feature Overview

The Gemini 3 Image Generation Tool is an AI image generation feature powered by MaiAgent's integration with the Google Gemini 3 Pro Image model. This tool enables AI Assistants to generate high-quality images based on users' text descriptions, supports both Traditional Chinese and English prompts, and allows style transfer and image editing through reference images.

Gemini 3 Pro Image is Google's latest multimodal AI model with powerful image generation capabilities. It can generate high-quality, contextually appropriate images based on contextual understanding and world knowledge reasoning.

Key Features

Feature Type	Description	Use Cases
Text-to-Image	Generate images based on text descriptions	Marketing materials, social media posts, product visualization
Reference Image Editing	Perform style transfer or content modification based on reference images	Brand visual consistency, image style adjustment
Conversational Image Editing	Continuously adjust and refine images across multi-turn conversations	Iterative design, detail fine-tuning
Chinese Prompt Support	Directly describe desired images in Traditional Chinese	Chinese-speaking users can use it without translation

Enable the Gemini 3 Image Generation Tool

Prerequisites

- Confirm your organization plan supports image generation
- Confirm AI feature permissions are enabled
- Prepare the AI Assistant that will use this tool

Enable Steps

Go to the AI Assistant Settings Page

- Click "AI Assistant" in the left menu
- Select the AI Assistant to configure

Settings

Navigate to "AI Assistant" from the left menu, select the assistant to configure, and click Settings

Configure Tool Settings

Switch to the "Tools" tab

Click the "Select Tools" button

Find "**Nano Banana Pro Image Generation**" in the available tools list and check it

Click "Confirm"

Switch to the "Tools" tab to view the enabled image generation tool

After clicking "Select Tools", find "Nano Banana Pro Image Generation" in the built-in tools and check it to enable

Save Settings

Click the "**Save**" button in the bottom right corner

Wait for the system to confirm the settings are complete

Notes - Image generation consumes token quota. Please be aware of your plan limits - Generated images default to 4K high-quality output

How to Use

Use via Chat Interface

Use the image generation tool in the MaiGPT chat interface. The AI Assistant generates images based on your description

Enter an Image Description

Type your desired image description in the chat box

Examples:

"Generate a landscape image of a sunset beach for me"

"Draw a cat wearing a spacesuit"

"Design a minimalist-style coffee shop logo"

"Create a watercolor painting of a mountain landscape"

Use Reference Images

Upload an image in the conversation as a reference

Combine with text instructions to describe the desired modifications

Examples:

Upload a photo and say: "Convert this photo to a watercolor painting style"

Upload a product image and say: "Design a promotional poster for this product"

Conversational Editing

After generating an image, request modifications in subsequent messages

Examples:

"Change the background to blue"

"Add some stars"

"Make the overall atmosphere warmer"

Conversational editing: The user requests changing the shopping bag to pink, and the AI Assistant regenerates the modified image based on context memory

The more detailed the description, the better the generated image quality. It is recommended to include details such as style, color, composition, and atmosphere.

Use Case Examples

Scenario 1: Marketing Material Creation

Requirement: Quickly generate visual materials for social media posts

Conversation Example:

User: Generate an Instagram-suitable image for me. The theme is spring new product launch, with a fresh and bright style, featuring cherry blossom and shopping bag elements.

AI: [Generated image] Created a spring new product launch promotional image for you, featuring cherry blossom petals and stylish shopping bag elements with an overall fresh and bright style.

User: Great, but can you change the shopping bag color to pink?

AI: [Generated updated image] The shopping bag has been adjusted to pink, making it more consistent with the cherry blossom theme.

Actual operation screen: The user inputs marketing material requirements, and the AI Assistant instantly generates a spring promotional image with cherry blossom and shopping bag elements

Scenario 2: Product Visualization

Requirement: Generate visual representations for product concepts not yet in production

Conversation Example:

User: I want to design a smartwatch with a round watch face, silver metal band, and deep blue dial. Please generate a concept image for me.

AI: [Generated image] Created a smartwatch concept image with a round watch face paired with a silver metal band and deep blue dial.

Actual operation screen: The AI Assistant generates a smartwatch concept image based on the description, featuring a round watch face, silver metal band, and deep blue dial

Scenario 3: Style Transfer

Requirement: Convert existing images to different artistic styles

Conversation Example:

User: [Upload photo] Convert this photo to comic style

AI: [Generated image] Your photo has been converted to comic style, preserving the original composition and main elements.

Actual operation screen: Converting Taipei 101 tower to Japanese anime style, preserving the main architectural outline and applying comic-style rendering

Prompt Writing Tips

Effective Prompt Writing

Include specific descriptions:

- Subject: What content you want to generate
- Style: Realistic, cartoon, watercolor, oil painting, graphic design, etc.
- Color: Main color tones and color preferences
- Composition: Close-up, panoramic, bird's-eye view, etc.
- Atmosphere: Warm, cool, lively, calm, etc.

Good examples:

- "An orange Shiba Inu sitting on a park bench in autumn, with golden maple leaves in the background, warm afternoon light, realistic photography style"
- "Minimalist-style tech company logo, using blue and white, geometric design"

Avoid being too vague:

- "Draw a picture" (lacks specific description)
- "A nice image" (no clear direction)

FAQ

Q: What languages does the Gemini 3 Image Generation Tool support for prompts?

A: It supports Traditional Chinese and English prompts. You can directly describe the desired image content in Chinese.

Q: How many tokens does it cost to generate one image?

A: Image generation consumes more tokens than text-only conversations. The actual consumption depends on the prompt complexity and image quality settings. It is recommended to monitor your organization's token usage to avoid exceeding plan limits.

Q: Can I use reference images?

A: Yes. Upload an image in the conversation as a reference, and the AI Assistant will incorporate it into the generation process. This is especially useful for style transfer, image editing, or creating based on existing materials.

Q: What is the resolution of generated images?

A: Images are generated in 4K high quality by default, suitable for most use cases.

Q: Can I continuously modify images across multi-turn conversations?

A: Yes. The AI Assistant remembers the conversation context. You can request detail adjustments, style modifications, or element additions in subsequent messages to progressively refine the image.

Q: What should I do if image generation fails?

A: Possible causes and solutions:

- **Prompt violates content policy:** Adjust the description to avoid inappropriate content
- **System is busy:** Try again later
- **Insufficient token quota:** Check the remaining quota of your organization plan

Text to SQL with Supabase

What Is Supabase?

Supabase is an open-source platform service designed to simplify modern application development. Its core features include:

Database: Store various types of data.

Real-time updates: Your application is notified immediately when data changes.

Account management: Manage user accounts and passwords.

Built-in authentication mechanism: A built-in authentication mechanism that simplifies user identity management and provides multiple authentication methods.

Auto-generated API (data access endpoints): Access your database data through simple methods.

Benefits of Integrating Supabase

Cross-table queries: Supabase supports multi-table relationships, allowing you to query relationships between Table A and Table B.

Indexing for improved query performance: You can create indexes on frequently queried content to help the AI assistant find what you need more precisely.

Set Up Your Supabase

1. Create a Supabase Account

First, go to the [Supabase website](#) and click "Sign in Start your project."

If you haven't registered yet, please create an account first to proceed with the following steps

After logging in, you can create a new organization or use an existing one. Within the organization, create a project — each project has its own independent database.

2. Navigate to the Database Page

After entering the project, click Database > Tables in the left navigation bar to add data

Create a New Table

Click "New Table" to create a table and name it:

Supabase offers several ways to create a new table:

Manually add columns: Suitable for designing the table structure from scratch. You can add columns one by one and set each column's data type, default value, etc.

Import .csv/.tsv or plain text: Suitable for quickly creating tables, especially when you already have existing data.

Notes:

The first row of a plain text file must contain column names, with columns separated by commas (CSV) or tabs (TSV).

Here, choose to import data: click "**Import data from CSV**" and paste a tab-separated text file. Scroll down to see the table result. After import is complete, click "Save."

Select import method

Import plain text

Preview result

Primary Key

After the import is complete, you are redirected to the settings page where you must specify a primary key. A primary key is like an ID number — it uniquely identifies each record. Here, we select Customer ID as the primary key.

Foreign Key

Scroll down to see the Foreign Key settings. A Foreign Key is like an address that points to the source of a record or more detailed data associated with it.

Suppose we have two tables: "Customers" and "Orders."

Customers Table:

CustomerID - Primary Key

CustomerName

Phone

Address

Orders Table:

OrderID - Primary Key

CustomerID - Foreign Key (references CustomerID in the Customers table)

OrderDate

TotalAmount

In this example, the "CustomerID" in the Orders table is a foreign key that references the primary key "CustomerID" in the Customers table. Through this foreign key, we can identify which customer placed each order.

In this example, the foreign key should be placed in the Order Table: Relationship direction: One customer → can have multiple orders (one-to-many relationship) One order → belongs to only one customer Foreign key principle: > The foreign key should be placed on the "many" side Therefore: The Order Table has a customer_id (foreign key), because it is the "many" side in the one-to-many relationship The Customer Table does not need to store order information

Therefore, we set up the Order Table to link the Customer ID in the Customer Table to the Customer ID in the Order Table.

After the relationship is configured, click "Save" to establish the database relationship.

3. Setup Complete

Once the tables are created, you have a complete database and can query data within it using SQL syntax.

How to Create a Supabase Tool

To use the Supabase tool on MaiAgent, you need to create it as an MCP tool so the AI assistant can access Supabase functionality:

For tool introduction, see: [Tool Overview](#)

Create a Server on an MCP Service Platform and Connect to Supabase

For how to connect MCP tools, see: [Remote MCP Service Overview](#). Currently, only the [Composio Platform](#) supports Supabase integration.

Enable Available Features in Composio

When connecting to Composio, enable basic database operations such as create, delete, query, etc.

Composio has basic options pre-selected under Important by default. You do not need additional configuration — just make sure the Important options remain checked.

Configure Actions for Supabase

Select the actions you want to enable for this MCP server using your connected Supabase account

Selected Actions: 7/30

Search actions...

☒ Important 7

☒ Execute project database query

☒ Create an organization

☒ Create new project

☒ Generate TypeScript types

☒ Get Table Schemas

☒ List all organizations

☒ List all projects

☐ Secrets 7

☐ DestructiveHint 22

☐ OpenWorldHint 54

Back

Create Server

Add the Configured Supabase Tool to the Available Tools List

For how to create MCP tools, see: [Create MCP Tools](#)

Supabase Tool Connection URL

After creating the server service on the MCP service platform, process the URL as follows:

Original URL (obtained from the MCP Server):\

https://backend.composio.dev/v3/mcp/12345678/mcp?include_composio_helper_actions=true

Remove "[?include_composio_helper_actions=true](#)" entirely

New URL (to paste on the MaiAgent tools page):\nhttps://backend.composio.dev/v3/mcp/12345678/mcp

You must remove the above content; otherwise, the AI assistant will not be able to use the Supabase tool correctly.

After the tool is created, go to the AI assistant settings and add the Supabase tool to the assistant's available tools list:

Make sure to click Save on the tools page; otherwise, the AI assistant still cannot use the Supabase tool.

Using the Supabase Tool

With MaiAgent AI assistant and the Supabase tool, simply describe the data you want to query in everyday language, and Supabase automatically generates the corresponding SQL syntax to extract the information you need from the relational database.

Sample Database

1. Customers Table

Column Name	Primary Key	Required	Description
CustomerID	Yes	Yes	Unique customer identifier
CustomerName	No	No	Customer company or individual name
CustomerType	No	No	Customer category (e.g., Retailer, Restaurant, Distributor)
ContactName	No	No	Primary contact name
Phone	No	No	Contact phone number
Email	No	No	Email address
Address	No	No	Customer address
Region	No	No	Geographic region (e.g., North, South)
CustomerLevel	No	No	Customer importance level (A, B, C)

Primary Key: CustomerID

Foreign Key Relationships: None

2. Orders Table

Column Name	Primary Key	Required	Description
OrderID	Yes	Yes	Unique order identifier
CustomerID	No	No	References the Customers table
OrderDate	No	No	Order creation date
DeliveryDate	No	No	Expected or actual delivery date
PaymentMethod	No	No	Payment method (Cash, Credit Card, Wire Transfer)
OrderStatus	No	No	Order processing status
TotalAmount	No	No	Order total amount (numeric)
ShippingFee	No	No	Shipping cost

Primary Key: OrderID

Foreign Key Relationships:

CustomerID → Customers.CustomerID (The CustomerID in Orders references the CustomerID in the Customers table)

3. Products Table

Column Name	Primary Key	Required	Description
ProductID	Yes	Yes	Unique product identifier
ProductName	No	No	Product name
Description	No	No	Detailed product description
Category	No	No	Product category
Brand	No	No	Product brand
Size	No	No	Product specification or size
Cost	No	No	Product cost (numeric)
Price	No	No	Product selling price (numeric)

Column Name	Primary Key	Required	Description
StockQuantity	No	No	Current stock quantity (numeric)

Primary Key: ProductID

Foreign Key Relationships: None

Scenario 1: Track Incomplete Orders

Database state: The Orders table has two incomplete orders: OR003 and OR004.

Filter	Sort	Insert	Add RLS policy	Enable Realtime	Role postgres		
OrderID	OrderID	OrderID	OrderID	OrderID	OrderID	OrderID	OrderID
OR001	OR001	OR001	OR001	OR001	OR001	OR001	OR001
OR002	OR002	OR002	OR002	OR002	OR002	OR002	OR002
OR003	OR003	OR003	OR003	OR003	OR003	OR003	OR003
OR004	OR004	OR004	OR004	OR004	OR004	OR004	OR004
OR005	OR005	OR005	OR005	OR005	OR005	OR005	OR005

Natural language input: In the AI assistant's chat, simply type: "Tell me which orders are not yet completed." The AI assistant automatically invokes the tool and generates a structured SQL query.

Supabase automatic query: The AI assistant automatically invokes the Supabase tool, converting your natural language into an SQL query, such as:

Combining the query results with the AI assistant's analysis, the AI assistant responds with the following order information, sorted by priority:

Through the collaboration of the Supabase tool and the AI assistant, you can easily track incomplete orders and receive analysis and prioritization suggestions from the AI assistant, enabling more efficient order processing and improved customer satisfaction.

Scenario 2: Query Contact Information for Incomplete Orders

Order OR003 is still being processed, with customer CU003 and the contact person being **Huang Procurement**

OrdersCustomers+

FilterSortInsertAdd RLS policyEnable RealtimeRole postgres

客戶編號 (CustomerID) text	聯絡人姓名 (ContactName) text	電話 (Phone) text
CU001	林經理	02-25811234
CU002	陳主南	02-27212345
CU003	黃探驊	03-3360000
CU004	張雲萍	06-2841000
CU005	吳老師	07-8060505

Page 1 of 1100 rows5 recordsDataDefinition

Natural language input: In the AI assistant's chat, type: "Who should I contact for the orders still being processed?" The AI assistant automatically invokes the tool and generates a structured SQL query.

[illegible]

Supabase automatic relational query: Although the conversation with the AI assistant is about the Orders table, through the configured foreign key relationships, Supabase knows that the **Customer ID** here references the **ID** in the **Customers** table, so the returned content comes from the **Customers** table.

AI assistant response: The AI assistant then provides the correct contact information and other contact methods based on its analysis.

Through the Supabase tool, you can fully leverage table relationships in the database to easily extract information from multiple related tables and receive a customer name list from the AI assistant. The clearly defined relationships between tables ensure data consistency and reliability, making query results more trustworthy.

Additional Notes:

You can adjust the natural language input based on your actual needs, such as: "Tell me about today's incomplete orders" or "Tell me about VIP customers' incomplete orders." The Supabase tool can accurately parse and execute these queries.

The AI assistant can further integrate other information, such as inventory status and logistics information, to provide more comprehensive order analysis.

The tool can only access data stored in your database. If you have analysis needs, make sure to upload the data to the database before starting the analysis.

Configure Tools for an AI Assistant

The tools you have created can now be selected in AI assistant settings, giving your AI assistants more powerful capabilities. This guide explains how to configure the tools you have created for a specific AI assistant.

Configure Tools

1. Enter AI Assistant Settings

First, navigate to the "AI Features" section from the left navigation bar, then click "AI Assistants". This will display a list of all AI assistants created in your account.

Find the AI assistant you want to configure tools for

2. Select the AI Assistant to Configure

In the AI assistant list, find the assistant you want to configure tools for, and click the "Edit" button to enter the detailed settings page for that assistant.

Enter the settings page of a specific AI assistant

3. Switch the AI Assistant's Response Mode

Important prerequisite: Only AI assistants set to Agent Mode can use tools. If your AI assistant is in another mode (e.g., General (Default) response mode), you cannot configure or use tools for it.

On the AI assistant's settings page, switch to the "Response Mode Settings" page tab.

Check: Confirm whether the currently selected mode is "Agent Mode"

Change: If it is not currently in Agent Mode, please **switch** it to Agent Mode.

Make sure the AI assistant is set to Agent Mode to use tools

4. Navigate to the Tool Configuration Page

On the AI assistant's settings page, find the "**Tools**" page tab.

Find the tool configuration page

5. Select Tools to Enable

On this tool configuration page, click the "**+ Select Tools**" button in the upper right corner. This will open a list of pre-built tools, where you can perform the following actions.

Actions:

Browse the list and find the tools you want this AI assistant to be able to use.

Check the checkbox next to the tools you want to enable.

You can select any number of tools based on the AI assistant's tasks and needs.

You can select MaiAgent built-in tools or tools you have defined yourself

Directly check the tools you want this AI assistant to use

Tip: Make sure to only configure tools that the AI assistant actually needs and is authorized to use. Configuring too many irrelevant tools may affect the AI's judgment accuracy and response efficiency.

6. Review Selected Tools

After completing your selections, you can review the tools configured for the AI assistant once more to ensure the correct tools have been configured for this AI assistant.

Confirm the correct tools have been configured for the AI assistant

Control System Functions

In addition to the tools you select, AI assistants have system functions enabled by default, such as searching the current conversation history, reading attachments, and generating download links. You can disable these functions individually based on each AI assistant's needs to reduce unnecessary token usage and make the assistant's behavior more predictable.

For example, a customer service supervisor creates an AI assistant that only answers frequently asked questions and does not process attachments. She opens the assistant's advanced settings, disables attachment reading and parsing, and saves the changes. The assistant can still answer knowledge base questions, but it will no longer attempt to parse files uploaded by customers.

1. Open Advanced Settings

Open the AI assistant you want to adjust and select **Advanced Settings** from the left side of the settings page.

2. Adjust System Functions

Scroll to **System Functions**, then enable or disable the following functions as needed:

Search conversation history

Get surrounding message context

Read plain-text attachments

Generate download links

After a function is disabled, the assistant can no longer use it, which may affect related responses.

Enable or disable system functions based on the AI assistant's purpose

3. Save the Settings

Click **Save** in the lower-right corner to apply the settings.

The last four functions in the list only work in **Agent Mode**. If you cannot change these toggles, go to **Response Mode Settings** and switch to Agent Mode first.

7. Save AI Assistant Settings

After completing your tool selections, **make sure to** click the "**Save**" button to save the changes you have made to the AI assistant settings.

Click "Save" to apply the tool configuration changes

Configure MaiAgent Built-in Tools

MaiAgent has four built-in AI image generation tools that you can apply to your AI assistants based on your needs, with no additional setup required:

For a comparison of the four tools, please refer to: [MaiAgent Built-in AI Image Generation Tools](#)

Now, your selected AI assistant has the ability to use these enabled tools. When interacting with this assistant, if a relevant scenario is triggered, the AI will attempt to call these tools to complete tasks or retrieve information.

Agent UI

1. What Is Agent UI?

Traditional AI assistants can only reply with plain text. **Agent UI** lets you design visual "information cards" for your AI assistant — when users ask questions, the AI assistant doesn't just talk, it can also send beautifully structured cards with images and buttons.

The currently supported card format is **FlexMessage**, which can render rich card UIs in Web Chat and LINE channels.

Agent UI Highlights: The AI assistant automatically determines when to send a card based on the conversation context, fills in the corresponding information, and users can tap card buttons to continue interacting.

Comparison: Plain Text vs. Agent UI Cards

Scenario	Plain Text Reply	Agent UI Card Reply
Industrial Equipment Spec Inquiry	"IBX-7800 Industrial Motherboard, Intel i7, DDR5, NT\$28,500"	Spec sheet (CPU/I/O/Operating Temp) + Stock tag + Request Quote Download Spec Sheet buttons
Credit Card Statement Inquiry	"Current spending \$6,508, payment due 06/15"	Transaction details + Current period/Rewards/Amount due + Pay Now button
Medical Appointment Confirmation	"Cardiology 06/03 14:00, Registration No. R2026053-088"	Doctor/Time/Location + Check-in QR Code + View Waiting Status button
Electronic Boarding Pass	"JX 802, TPE 09:25 → NRT 13:35, Seat 12A"	Flight segment/Class/Seat/Baggage + Boarding QR Code + Online Seat Selection button

Live Conversation Demo

Whether it's B2B manufacturers inquiring about product specs, customers checking appointment information, or users viewing boarding passes directly in a conversation — the AI assistant automatically sends the corresponding card based on the conversation context, presenting all information clearly at once.

Manufacturing example: Customer asks "Recommend an industrial computer motherboard," AI assistant returns a product card with CPU, I/O, operating temperature specs and a "Request Quote" button

Medical clinic example: User checks appointment information, AI assistant returns an appointment confirmation card with department, time, location, and QR Code check-in, plus a "View Waiting Status" button

Airline example: User checks flight information, AI assistant presents an electronic boarding pass card with flight segment, class, seat, baggage allowance, and boarding QR Code

For more industry scenarios, see "[5. Use Case Examples: Six Industry Scenarios](#)" below.

2. Core Concepts

Fixed Fields vs. AI-Generated Content

Each field in a card can be set to either a "fixed default value" or "let AI fill in dynamically from the conversation context":

Field	Configuration	Use Case
Fixed Value (Default)	Enter fixed text directly	Brand name, card title, fixed labels (e.g., TRANSACTION , BOOKING PASS)
AI-Generated (AI Prompt)	Describe in natural language what AI should	Last four digits of customer account, spending amount, amount due — any information that needs to be retrieved from the

Field	Configuration	Use Case
	fill in	knowledge base or conversation

Example (Financial Statement Card):

Field	Default Value (Fixed)	AI Prompt (Dynamic)
Title Label	TRANSACTION (fixed)	—
Card Title	Credit Card Statement (fixed)	—
Statement Period last four card	—	Retrieve statement period and digits from the billing database
Description Transaction List for this period	—	List major merchants and amounts
Total Spending period from	—	Retrieve total spending for this the billing database
Rewards from the	—	Retrieve current period rewards membership system
Amount Due deducting rewards	—	Calculate amount due after from total spending
Payment Deadline the billing	—	Retrieve payment deadline from database
Button Text	Pay Now (fixed)	—
Payment Link link using	—	Generate personalized payment statement number

What Can Card Buttons Do?

FlexMessage cards support two types of interactive buttons:

URL Button

Opens a specified URL when clicked.

Use Cases:

- Manufacturing: Open product technical spec PDF, schedule a Demo form
- Finance: Jump to statement payment page, credit card application form
- Education: Open admissions brochure, registration link

- Medical: View waiting status, cancel appointment page
- Airlines: Online seat selection, add-on baggage or meals

Configuration: In the "Link" field's AI prompt, enter "Retrieve the corresponding page link from the knowledge base," and AI will automatically populate the correct URL.

Prompt Button

Automatically sends a message to the AI assistant when clicked, and AI continues the conversation.

Workflow (Education enrollment scenario example):

```
User: "Tell me about courses or admissions"
    ↓
AI returns a course progress card (In-progress courses
Pending assignments
Open enrollment)
    ↓
User clicks "Enroll Now" button
    ↓ (Button triggers prompt: "I want to enroll in the summer internship")
AI continues: "What is your current department and year? What is your preferred
internship field?"
```

Use Cases:

- Trigger follow-up processes (enrollment, appointments, applications, reservations)
- Ask "View full details" or "View other room types" to expand more information
- Collect additional information AI needs to continue serving the user

3. Creating an Agent UI (FlexMessage)

Navigate to the Agent UI Page

In the left menu, click **AI Features** → **Agent UI**, then click **Add Agent UI** in the top right corner.

Agent UI management list showing created card tools and their associated AI assistants

Select Card Type

Currently available: **FlexMessage Card Information Display**. Click to enter the configuration page.

Select card type — currently supports FlexMessage

Fill In Basic Information

After filling in basic information, you can select a template and configure AI fields

Field	Description
Display Name	Name shown in the admin dashboard for easy identification (e.g., <code>Finance/Banking/Securities Product Card</code>)
Tool Name	English name for AI model identification. Naming rules: English letters, underscores, no spaces (e.g., <code>finance_product_card</code> , <code>medical_clinic_card</code> , <code>airline_flight_card</code>)
Description	Describe the purpose of this card tool (optional)
Prompt	Tell the AI assistant when to use this card (e.g., "When users ask about credit card statements, payment information, or current spending details, return the statement card")

The prompt is the trigger key. The more specific you write it, the better AI knows when to proactively send a card instead of just replying with text.

Select a Template

Click a preset template on the left to preview the card style on the right in real time. After confirming, click **Apply This Template**.

12 Built-in Templates and Applicable Industries:

Template	Use Case	Suitable Industries
Restaurant	Store recommendations, reservations	Food & Beverage, Tourism
Hotel	Room type display, booking	Hotels, Accommodations
Local Search	Location search, nearby recommendations	Tourism, Retail
Real Estate	Property introduction, viewing appointments	Real Estate, Rentals
Apparel	Product display, spec introduction	Retail, E-commerce, Manufacturing
Transit	Routes/Flights/Schedules	Transportation, Airlines, Logistics
Shopping	Product comparison, shopping cart	Retail, E-commerce
Menu	Item display, menu	Food & Beverage, Retail
Receipt	Statements, order receipts, transaction details	Finance, Retail, E-commerce
Ticket	Tickets, boarding passes, appointment confirmations	Airlines, Events, Medical Registration
Social	Profile cards, social profiles	Education, HR, Social
TODO app	Task lists, course progress, work order status	Education, Customer Service, Manufacturing Work Orders
Custom	Paste custom FlexMessage JSON	Any scenario requiring custom layouts

Selecting a template is just the starting point. After applying, you can freely adjust the content and logic of each field in the "AI Field Settings."

Configure AI Fields

After applying a template, the system automatically parses all editable fields in the card:

Each field can have a fixed default value, or an AI prompt for AI to dynamically generate content

Each field has three properties:

Type: The field's data type (text, image, button, link)

Default Value: Fixed content to display (if an AI prompt is also set, AI-generated content takes priority)

AI Prompt: Tells AI what to fill in this field, e.g., "Based on the user's query, retrieve the corresponding product name

account information

department from the knowledge base"

The **live preview** on the right updates with your settings, so you can confirm the card's visual appearance.

Save

After confirming all settings, click **Save** in the top right corner. The Agent UI tool is now created and will appear in the list.

4. Binding to an AI Assistant

After creating an Agent UI, you need to attach it to an AI assistant so the assistant knows it can use this card.

Go to AI Assistant Settings

Navigate to **AI Features** → **AI Assistants**, select the AI assistant you want to configure, and click **Settings**.

Open the Agent UI Tab

In the settings page tab bar, click **Agent UI**.

In the AI assistant settings page, you can manage all bound Agent UI tools

Add Agent UI

Click **Select Agent UI** and choose the card tool to add from the list.

A single AI assistant can bind **multiple** Agent UIs

Each Agent UI's **prompt** determines when AI uses which card

Save

Click **Save** in the bottom right corner. The settings take effect immediately.

5. Use Case Examples: Six Industry Scenarios

From manufacturing, finance, and education to medical, hospitality, and airlines — every industry can design custom cards tailored to their needs, enabling AI assistants to respond to users in the most intuitive way. Below are actual conversation demos from six typical enterprise scenarios.

All examples in this section have been built and tested on the MaiAgent platform. A single AI assistant can bind multiple Agent UIs simultaneously, and AI will automatically select the appropriate card based on the user's question.

Multi-Card Management for One Assistant

Configure multiple industry scenarios in the admin dashboard and attach them to the same AI assistant:

One AI assistant bound with six industry cards — AI automatically selects the appropriate card based on the user's question

Example Configuration Tutorial: Financial Statement Card

Below is a complete walkthrough using the "Finance — Statement Inquiry" as an example, demonstrating the entire process from zero configuration to live conversation. Other industries can follow the same approach.

Scenario Description

A bank wants members to receive a statement card (with transaction details, amount due, payment deadline, and a "Pay Now" button) when they ask about their current statement on LINE or Web Chat, instead of a plain text reply.

Configuration Details

Agent UI Settings:

Field	Setting
Display Name	Finance/Banking/Securities Product Card
Tool Name	finance_product_card
Prompt	When users ask about current spending, payment information, credit card statements, or transaction details, return the statement card
Template	Receipt

AI Field Settings:

Field	Default Value	AI Prompt
Title Label	TRANSACTION	—
Card Title	Credit Card Statement	—
Statement Period Description	—	Retrieve statement period and last four card digits from the billing database
Transaction List	—	List major merchants and amounts for this period
Total Spending	—	Retrieve total spending for this period from the billing database
Rewards	—	Retrieve current period rewards from the membership system
Amount Due	—	Calculate amount due after deducting rewards from total spending
Payment Deadline	—	Retrieve payment deadline from the billing database
Statement Number	—	Retrieve statement number from the billing database
Button Text	Pay Now	—

Field	Default Value	AI Prompt
Payment Link	—	Generate personalized payment link using statement number

Logic for choosing "Fixed Value" vs. "AI Prompt": Use fixed values for content that doesn't change with conversations, such as brand labels and button text. Use AI prompts for content that needs to be retrieved from systems, such as customer accounts, spending amounts, and payment links.

Live Conversation Result

After the user asks a question, the AI assistant automatically triggers the card tool, retrieves data from the billing database and membership system, and fills in the fields:

User enters "Recommend a credit card or financial product" (or "Check my statement for this period"), AI assistant returns a statement card with transaction details, amount due, and payment deadline — user can click "Pay Now" to complete payment directly

Six Industry Scenario Overview

Once you understand the configuration logic above, you can apply the same approach to different industries. Here are six typical scenarios:

1. Tech/Electronics Manufacturing: Product Catalog and Spec Inquiry

When customers or sales teams inquire about industrial computers, embedded systems, AOI inspection equipment, and other products, the AI assistant automatically returns product cards with complete specs, pricing, stock status, and "Request Quote" "Schedule Demo" buttons, accelerating the B2B sales process.

User: "Recommend an industrial computer motherboard" — AI assistant returns a product card with complete specs including CPU, I/O, and operating temperature

2. Finance/Banking/Securities: Statements and Product Recommendations

For financial scenarios such as statements, credit card recommendations, financial plans, and insurance inquiries, the AI assistant can integrate internal system data to return structured financial information cards with "Pay Now" "Apply" CTAs.

User: "Recommend a credit card or financial product" — AI assistant returns a statement card with current transaction details, rewards, and payment deadline, with a "Pay Now" button

3. Educational Institutions: Course Progress and Enrollment

Students can instantly check course progress, pending assignments, completed grades, and admissions information. Schools can also use the AI assistant to push campus announcements and registration links.

User: "Tell me about courses or admissions" — AI assistant returns a course progress card with in-progress courses, pending assignments, and open enrollment statuses

4. Medical Clinics: Appointment Registration and Clinic Information

For scenarios including department introductions, clinic schedules, appointment registration, QR Code check-in, and health education information — patients can complete appointments and check waiting status directly on LINE or Web Chat, reducing call center workload.

User: "Show me departments and clinic schedules" — AI assistant returns an appointment confirmation card with doctor, time, location, and QR Code, providing "View Waiting Status" and "Cancel Appointment" buttons

5. Hospitality/Hotel Industry: Room Booking and Marketing Recommendations

For hospitality scenarios including room type recommendations, restaurant reservations, event registration, and membership benefits — visual cards display pricing, ratings, promotions, and booking CTAs, improving conversion rates.

User: "Recommend hotels or reservation info" — AI assistant returns room type and restaurant recommendations simultaneously, with ratings, limited-time offers, and booking/reservation buttons

6. Airlines: Flight Information and Electronic Boarding Passes

For scenarios including flight inquiries, class comparisons, baggage regulations, and online seat selection, the AI assistant can directly present electronic boarding pass QR Codes, seats, baggage allowances, and other key information — no need to open a separate app.

User: "Check flight and seat information" — AI assistant returns an electronic boarding pass card with TPE→NRT flight segment, seat, baggage allowance, and boarding QR Code

6. FAQ

- What are the naming rules for tool names?
- How should I write an effective prompt?
- What happens if the AI prompt for a field is not filled in?
- Can a single AI assistant have multiple Agent UIs attached?
- Can Agent UI be used on LINE channels?

Skills

Skills Feature Overview

What Is a Skill?

A skill is like a **professional certification** for an AI assistant — each skill learned gives the AI assistant an additional professional capability. If tools are the "screwdrivers in the AI assistant's toolbox," then skills are "a complete set of Standard Operating Procedures (SOPs)" that not only tell the AI assistant what tools to use, but also **when to use them, how to use them, and how to respond after using them**.

Imagine you're running a customer service center:

Without skills:

Customer: "I want to return an item"

AI agent: "Sure, what's your order number?" (*can only handle basic Q&A*)

With skills:

Customer: "I want to return an item"

AI agent: "Sure!" (*automatically activates the return process skill*) → Query order → Verify return eligibility → Generate return form → "Your return request has been created. The return number is RT-20260324, and processing is expected to complete within 3-5 business days."

Core Components of a Skill

Each skill consists of three parts:

Instructions: Detailed instructions in Markdown format, like an SOP that guides the AI assistant through task completion step by step

Attached Tools: Tools required by the skill (MCP tools, API tools, etc.) that enable the AI assistant to perform actual operations

Resource Files: Attachment data that the skill can reference during execution (only available for skills created via upload)

How Skills Work

A complete skill workflow is as follows:

Create a skill:

Define the skill's name and description (the description determines when the AI triggers this skill)

Write detailed instructions (SOP in Markdown format)

Bind the required tools

Bind to an AI assistant:

Select the skills to use in the AI assistant's settings

An AI assistant can have multiple skills bound to it

User asks a question:

The user makes a request to the AI assistant in natural language

Example: "Check how many vacation days I have left"

AI assistant evaluates and activates the skill:

The AI assistant matches the user's question against the descriptions of bound skills

Determines which skill should handle the question

Automatically expands the complete instructions for that skill

Execute instructions and call tools:

The AI assistant follows the steps in the skill instructions one by one

Automatically calls the skill's attached tools when needed (querying databases, calling APIs, etc.)

Generate the final response:

The AI assistant consolidates the results returned by tools

Generates a structured response according to the reply format defined in the skill instructions

Key Advantages of Skills

Standardize Complex Tasks

Without skills: The AI assistant can only answer based on general knowledge, resulting in inconsistent quality

With skills: Every execution follows the SOP, ensuring consistent response quality

Precise Triggering and Task Division

Through trigger conditions in descriptions, the AI assistant can automatically determine when to use which skill

Different skills handle different tasks, achieving modular capability division

Reusable and Shareable

A single skill can be bound to multiple AI assistants
Skills can be exported as `.skill` files and shared with other organizations

Encapsulated Instructions and Tools

Bundle "what to do" (instructions) and "what to use" (tools) together
No need to repeatedly write extensive process details in the AI assistant's role instructions

Differences Between Skills and Tools

Comparison	Tools	Skills
Nature	A single external capability (API, MCP)	A complete execution workflow
Contents	API endpoint MCP server	Instructions + Tools + Resources
Analogy	Screwdriver	Assembly manual + Screwdriver
Trigger method	AI decides on its own whether to call it	Matched based on trigger conditions in the description
Use cases	Single actions (check weather, send email)	Multi-step workflows (return processing, vacation calculation)

Skills and tools are complementary: skills invoke tool capabilities through "attached tools," while tools provide the actual execution capabilities that skills need.

Practical Application Scenarios

Enterprise Customer Service

Skill: Return Processing Workflow

Trigger: When a customer requests a return or exchange

Steps: Query order → Verify return eligibility → Create return form → Reply with processing result

Attached tools: Order Query API, Return System API

Government Agencies

Skill: Vacation Day Calculation

Trigger: When a user asks about vacation days or annual leave days

Steps: Confirm personnel category → Search regulatory examples → Compare and calculate → Produce result

Attached tools: Knowledge base search

E-commerce Platforms

Skill: Customer Data Collection

Trigger: When a customer expresses purchase intent or requests a quote

Steps: Guide them to provide name/company/contact information → Write to CRM

Attached tools: Google Sheet API, CRM tool

Marketing Teams

Skill: Email Sending Service

Trigger: When a user requests to send an email or contact a customer

Steps: Confirm recipient → Compose email content → Send

Attached tools: Gmail MCP tool

Skills Management

If you're not yet familiar with what skills are, please read: [Skill Overview](#)

Creating Skills

Click [Skills](#) in the left sidebar to enter the skills management page, then click the [Add Skill](#) button in the upper right corner.

The system provides two creation methods:

Method 1: Manual Creation

Suitable for writing skill instructions from scratch.

In the add skill dialog, click the [Switch to manual creation](#) link at the bottom to switch to manual mode

Fill in the [Basic Settings](#) tab:

Skill Name (required): Give the skill an easily identifiable name

Description (required): Briefly describe the skill's purpose

Manual skill creation — Basic Settings tab

Switch to the **Instructions** tab and write instructions in Markdown format. You can also click the **Apply Template** button to use a system-provided default template as a starting point

Instructions tab — Supports Markdown format and template application

(Optional) Switch to the **Attached Tools** tab to select the tools required by the skill

Click **Save** to complete creation

Method 2: Upload Skill Package

Suitable for importing pre-packaged **.skill** or **.zip** files.

In the add skill dialog (upload mode by default), drag and drop the **.skill** or **.zip** file into the upload area, or click the area to select a file

Upload skill package — Supports .skill or .zip format

After the upload is complete, the system automatically parses the `SKILL.md` file to extract the skill name, description, and instructions

After successful creation, you are automatically redirected to the edit page where you can further adjust the settings

The skill package must contain a SKILL.md file in the following format: markdown --- name: Skill Name description: Skill Description --- This is where the AI assistant's execution instructions go...

Editing and Configuring Skills

In the skill list, click the `Edit` icon for the skill to enter the skill settings page.

Basic Settings

Edit the skill's name and description.

Edit skill — Basic Settings

Instructions

Edit the skill instructions in Markdown format. These instructions serve as the execution guide when the AI assistant activates the skill.

Click **Apply Template** to load a default instruction template.

Applying a template will overwrite the current instructions. Please confirm before proceeding.

Skill Package (Upload-created skills only)

If the skill was created by uploading a `.skill` `.zip` file, this tab displays:

Skill package info: File name, size, upload time

Preview: Expand to view the file structure within the skill package

Download: Export the skill package file

Re-upload skill package: Upload a new version to replace the existing skill package

Edit skill — Instructions (with practical examples)

Attached Tools

Bind the required tools to the skill so the AI assistant can call them when executing the skill.

Click the **Select Tools** button to open the tool selection dialog

Check the tools to attach (multiple selection supported), then click Confirm

Selected tools appear in the list, showing the tool name, type (API MCP), and description

To remove a tool, click the delete icon on the tool card

Attached Tools tab

After completing the configuration, click the **Save** button in the lower right corner of the page.

Exporting Skills

In the skill edit page's **Skill Package** tab, click the **Download** button to export the skill as a **.skill** file.

Manually created skills can also be exported. The system automatically packages the instructions and resources into a .skill file. Exported skill packages can be shared with other organizations for import.

Binding Skills to an AI Assistant

Skills must be bound to an AI assistant to take effect:

Go to the **AI Assistant** page, select the target AI assistant, and enter its settings

Find the **Skills** setting in the model configuration area

Select the skills to bind and click Confirm

Save the AI assistant settings

Once bound, the AI assistant automatically determines whether to activate a skill based on the user's question during conversations and executes the corresponding task according to the skill instructions.

Controlling Skill Visibility and Permissions by Role

If you want members with specific roles to see only the skills relevant to their work, you can use role permission management to assign skills to each role individually.

For example, suppose a company's system administrator wants sales representatives to be able to read the “Customer Summary” skill but not modify or delete it. The administrator can edit the sales role, assign this skill, and grant read permission only. Once configured, sales representatives can see “Customer Summary” in the skill list without receiving permission to modify or delete it.

How It Works

Unassigned means hidden: Skills created by the organization must be assigned to a role before members with that role can see them in the skill list. Unassigned skills are completely hidden from that role

Granular permissions: Each “role × skill” assignment can have its **Read**, **Edit**, and **Delete** permissions configured independently, allowing read-only scenarios such as “can read but cannot modify”

Create permission: Each role has its own “Allow skill creation” toggle, which controls whether members with that role can create skills

Owners are unrestricted: Organization owners automatically have full access to all skills and do not require assignments

Global skill exception: Built-in global skills are visible to all members and cannot be restricted through role assignments

Configuration Steps

Open Role Settings

From the left sidebar, select “**Organization Settings**” → “**Organization Overview**,” then click “**Edit Role Permissions**.” Select the role you want to configure, then switch to the “**Assign Skills**” tab.

Set Skill Creation Permission

Select or clear “**Allow skill creation**” as needed to determine whether members with this role can create skills. Changes are saved immediately, and a success message appears after the update is complete.

Assign Skills

Click the “Assign Skills” button, select the skills you want to make available to this role, and confirm your selection.

Set Skill Permissions

In the assigned skills list, configure the read, edit, and delete permissions for each skill individually, or remove the assignment. Permission changes are saved immediately when selected or cleared. A success message appears after the update, and there is no separate “Save” button on the page.

Manage skill creation permission and individual skill permissions on the “Assign Skills” tab

1

Select the skills to assign to the role from the available skills

For information about creating roles and assigning members, see [Role Permission Management](#).

Deleting Skills

In the skill list, click the **Delete** icon for the skill, then confirm to delete it.

After deleting a skill, AI assistants that had this skill bound will no longer be able to use it. This action cannot be undone.

Agent Teams

What is Agent Teams?

1. What is Agent Teams?

In the past, a single AI assistant had to handle everything: customer service routing, order inquiries, returns and exchanges, product recommendations — all crammed into one system prompt, one knowledge base, and one set of tools. As tasks piled up, this "jack-of-all-trades" assistant started dropping the ball — the system prompt grew too long, knowledge bases interfered with each other, and costs stayed high.

Agent Teams lets you replace "one generalist" with "a group of specialists." You can compose multiple existing AI assistants into a team, each with its own role (for example: a routing agent, an order agent, a returns agent, and a recommendation agent), then use a visual canvas to define "when should a question be handed to whom."

Users see **a single conversation entry point**; behind the scenes, the team automatically routes questions to the most suitable agent, as if the user were interacting with an entire professional team.

Value to you: Each agent retains its own independent knowledge base, tools, and model settings without interference. Only the agent actually handling the question loads the relevant content, saving tokens and making each agent more focused and accurate. When you add a new business scenario, you simply add an agent node and draw a connection — no need to rewrite existing agents.

2. How is this different from "single agent + skills"?

Aspect	Single Agent (with Skills)	Agent Teams
Division of work	One agent handles all scenarios	Multiple agents each responsible for their area of expertise
Knowledge & tools	All attached to the same agent, prone to interference	Each agent independently owns its own knowledge base, tools, and model
Model cost	Only one model for all tasks	Use lightweight models for simple tasks and powerful models for complex reasoning, configured separately
Collaboration	Cannot hand off or delegate between agents	Supports handoff and delegate between agents

Aspect	Single Agent (with Skills)	Agent Teams
Scalability	New scenarios require modifying the existing agent's settings	Just add a new node and draw a connection

3. Three interaction types: Handoff, Delegate, Auto

Agents in a team collaborate through **connections (directed arrows)**. Each connection can be configured with an interaction type that determines "how control flows once the question reaches the other agent." The three types are explained below, with accompanying diagrams.

Handoff

Handoff **transfers control of the entire conversation**: the source agent determines that someone else should handle this matter and passes the conversation to the target agent, who **takes over** and continues talking with the user — like a customer service rep transferring a call to another department, after which the new person takes over.

Best for: Parallel division of work where each agent handles its own domain. For example, a routing agent determines the user's intent and hands the conversation off to an order inquiry agent or a returns agent.

Handoff: The source agent transfers control, and the target agent takes over the conversation with the user

Delegate

Delegate **outsources a subtask**: the source agent asks the target agent to handle something specific, the target agent completes it and **returns the result**, while control remains with the source agent — like a colleague looking up some data for you and reporting back, with you still being the one who compiles the final response.

Best for: Hierarchical collaboration. For example, a customer service agent receives an inventory check request, delegates the inventory query to a warehouse agent, and then compiles the response for the customer.

Delegate: The source agent sends a subtask to the target agent and compiles the response after getting the result back

Auto (Default)

Auto lets the AI **decide on the spot** whether to use handoff or delegate based on the current situation. Use this when you are not sure which type to choose or want to keep things flexible.

Auto: The AI decides on the spot whether to hand off or delegate

Communication volume and cost differences across the three types

When multiple agents collaborate, the most common concern is: **will token costs spiral out of control?** The key lies in how much content is passed between agents across the three types:

Aspect	Handoff	Delegate	Auto
Control	Transferred to the target agent	Stays with the source agent	Decided by the AI on the spot
Content passed between agents	The target agent reads the accumulated conversation context when taking over	The source agent only sends "one subtask" to the target agent — concise and well-scoped	Depends on the type chosen
Token/cost characteristics	Grows with conversation length and number of handoffs; only one agent runs at a time	Adds a sub-agent run on top of the current turn (one extra LLM call), but the sub-agent's input is concise and scope is controllable	Falls on whichever type is selected, harder to predict in advance
Predictability	Medium	High (task scope is well-defined)	Low (varies by situation)

Costs are controllable and observable. The team has multiple built-in safeguards: Max iterations (default 25): Limits how many times agents can go back and forth in a single conversation, preventing infinite loops. Overall token limit (default 200000): The token budget cap for the entire team processing a single message. Timeout, and per-node configurable per-call token limits. Context strategy: Turn off "visible original user input" for a node so that agent only receives the summarized output from upstream agents rather than the full conversation, further saving tokens. Execution traces: Every execution records total tokens and cost breakdown per agent, making it clear where tokens are spent (see [Team execution traces](#)).

The conversation "remembers" who is currently serving. After a handoff, the receiving agent continues serving the subsequent conversation until it determines another handoff is needed; the next message does not go back to the entry point for re-routing.

4. Typical use cases

E-commerce customer service team: A routing agent determines intent and **hands off** to order returns recommendation agents, each with their own knowledge base and tools.

Enterprise internal helpdesk: HR agent + IT agent + Finance agent, automatically routing employee questions to the appropriate desk.

Technical support team: L1 agent performs initial troubleshooting, **delegates** to L2 agent for deeper analysis, and the result is returned to L1 for a compiled response.

5. How it works (concepts)

Agent Teams uses a **directed graph** to describe the team:

Nodes (agents): Each node on the graph is an existing AI assistant, carrying its own system prompt, knowledge base, tools, and model.

Entry node: When the team receives a message, processing starts from this node. A team has exactly one entry node.

Connections (directed arrows): Define "from which agent, under what conditions, using which interaction type, to which agent."

Guardrails: The team has upper limits for max iterations, overall token limit, and timeout to prevent agents from looping endlessly.

When you create a team, the system automatically creates an **entry agent** and a corresponding **Web Chat channel** for the team, allowing you to chat with the entire team directly through the channel.

6. Next steps

Ready to create a team? See [Create and orchestrate teams](#) — how to create a new team, drag in agent nodes, draw connections to set interaction types, designate an entry point, and start a conversation.

Want to see how the team operates? See [Team execution traces](#) — which agents were involved in each execution, how many tokens each used, and how long it took.

Prerequisite: Agent Teams must be enabled by MaiAgent for your organization. If you do not see the "Teams" menu under "AI Features" in the admin panel, contact the MaiAgent team to activate it.

Create and orchestrate teams

This page explains how to build an Agent Team from scratch: create a team, add agents on the canvas, configure connections and interaction types between them, designate the entry node, and start chatting with the entire team.

Prepare the AI assistants you want to add to the team first. Each node in a team is an existing AI assistant, so create your specialized assistants (e.g., routing, order, returns agents) under "AI Assistants" first, then come back here to compose them into a team.

1. Create a team

1. Go to the team list

From the left menu, navigate to **AI Features** > **Teams**. The list shows all teams in your organization, including **team name**, **number of agents**, and **status**. Use the search bar in the upper right to find a team.

Team list: view each team's name, number of agents, and activation status

2. Create a team

Click **Create Team** in the upper right corner, fill in the **Team name** (required) and **Description**, then create.

取消 確認

Create team: enter the team name and description

After successful creation, the system automatically creates an entry agent and a corresponding Web Chat channel for this team, so you can chat with the entire team right away.

2. Orchestrate the team on the canvas

Click into a team to enter the default **Canvas Orchestration** view. The screen is divided into three areas: the **Agent List** on the left, the **Canvas** in the center, and the **Settings Panel** on the right (appears when you select a node or connection).

Zoomed-in team graph: the entry node "Customer Service Routing Agent" uses "handoff" to route to Order Inquiry Returns

Product Recommendation agents, and the Order Inquiry agent "delegates" to the Inventory Query agent. Each node displays the agent name, model, and Agent/RAG mode; the entry node is labeled "Entry" (the actual screen also has the Agent List on the left and the Settings Panel on the right)

Canvas orchestration is best done on a desktop browser. On small screens like mobile devices, the canvas area will show a prompt asking you to switch to desktop for orchestration.

1. Add agent nodes

In the **Agent List** on the left, find the agent you want to add and **drag it onto the canvas**, or **click** it to add. Agents already in the team are labeled "Already in team" — clicking them will navigate to the corresponding node on the canvas. Use the search box at the top to filter when you have many agents.

Each node displays the agent name, the model it uses, and whether it is in **Agent** or **RAG** mode for easy identification.

If node positions are messy, click **Auto Layout** on the canvas to have the system rearrange them. Node positions are saved automatically.

2. Configure nodes

Click a node to open the **Node Settings** panel on the right. You can adjust:

Setting	Description
Entry node	When enabled, the team starts processing conversations from this node. A team can have only one entry node.
Per-call token limit	Limits the token count for a single response from this node (optional).
Max iteration count	Limits the number of iterations for a single processing cycle on this node (optional).
Context strategy	Controls what this agent can see: " Visible original user input " determines whether it can read the user's original message (when off, it only sees the processed output from upstream agents); " Visible output sources " lets you specify which nodes' outputs it can see.

Node settings: designate the entry node, set token/iteration limits, and configure the context strategy

3. Draw connections and set interaction types

Drag from one node's connection point to another node to create a **directed connection** (source -> target). Click the connection to open the **Connection Settings** panel on the right:

Setting	Description
Trigger condition description	Describe in plain language "when should this connection be used." This description is provided to the AI as a basis for routing decisions — writing it clearly helps improve routing accuracy.
Interaction type	Choose Auto , Handoff , or Delegate (see the table below for differences).
Inherit source agent's tools	When enabled, the target agent can use all tools and resources from the source agent.

Interaction types (descriptions as shown in the settings panel):

Interaction type	Description
Auto (default)	The LLM automatically determines the most suitable interaction type.
Handoff	Hand off control — the source agent goes idle and the target agent takes over the conversation.
Delegate	Delegate a task — the target agent executes and returns the result to the source.

繼承來源 Agent 的工具

開啟後，目標 Agent 可使用來源 Agent 的所有工具和資源

☐

Connection settings: fill in the trigger condition description, select the interaction type (auto/handoff/delegate), and optionally inherit the source agent's tools

Watch for semantic warnings at the top of the canvas. When the team graph has issues, a yellow notice appears at the top of the canvas, such as: "No entry node set," "Multiple entry nodes — keep only one," "Duplicate connections," or "Connections form a cycle." It is recommended to resolve these warnings before starting a conversation.

3. Configure basic information and guardrails

In the team page, switch to the **Basic Information** view to adjust team-level settings:

Basic information: Team name, description, and whether it is enabled.

Guardrails:

Max iterations (default **25**) — The maximum number of times agents can go back and forth in a single conversation, preventing infinite loops.

Overall token limit (default **200000**) — The token budget cap for the entire team processing a single user message.

Timeout (default **600** seconds) — The hard timeout for the entire team's processing flow.

Basic information and guardrails: adjust team name, activation status, and max iterations, overall token limit, and timeout

4. Chat with the team

Once orchestration is complete and the team is "Enabled," you can chat with the entire team through the team's **Web Chat channel**. Users face a single entry point, and the system automatically routes questions to the appropriate agent.

When the team performs handoffs or delegates between agents, the chat interface displays transition messages such as "**Handing off to**," "**Delegating to**," or "**Switching to**," letting users know which agent is currently serving them.

5. Delete a team

In the danger zone at the bottom of the [Basic Information](#) view, you can [Delete Team](#). Deleting a team also removes its entry agent, and **this action cannot be undone** — please confirm before proceeding.

6. Next steps

Once the team is running, you can check the [Team execution traces](#) to see which agents were involved in each execution, how many tokens each used, and how long it took — confirming the team is dividing work as expected.

Team execution traces

Teams automatically hand off and delegate work between assistants without interrupting the user. **Execution records** let you review which assistants handled each conversation and how many resources they used. Use them to confirm that the team divided work as expected and to troubleshoot and optimize it.

1. View execution records

On the team page, switch to **Execution records** to see every run for this team. Each message a user sends to the team creates one record. Each record includes:

Field	Description
Record ID	Unique identifier for this run.
Conversation	The conversation this run belongs to, shown by its title. Click the title to open All conversations and view the full conversation.
Status	Running, Completed, Failed, or Timed out.
Iterations	Total number of exchanges between assistants during this run.
Tokens	Total tokens used in this run (input <code>in</code> output <code>out</code>).
Duration	Total time from receiving the message to completing the reply.
Created at	When this run occurred. Click the column heading to switch between oldest-first and newest-first sorting; the default is newest first.

	記錄 ID	對話	狀態	迭代數	TOKEN 數	操作
+	...	請問你們的營業時間和運費怎...	已完成	1	1,003 in / 50 out	🔍 ⚙️
+	...	你好，我上週買的藍芽耳機右...	已完成	1	1,076 in / 124 out	🔍 ⚙️
+	...	你好，我上週買的藍芽耳機右...	已完成	2	2,036 in / 181 out	🔍 ⚙️

Execution records: each record shows its conversation title, so you can see at a glance which records belong to the same conversation

Can't open a conversation title? You need access to Conversation records for titles to appear as links. Without access, titles appear as plain text (hover over a title to see why).

2. Filter execution records by conversation

A conversation usually contains several messages, each with its own execution record. To focus on one conversation, show only its records.

1. Filter by this conversation

In the **Actions** column to the right of the record you want to inspect, click the funnel icon **Filter by this conversation**.

The screenshot shows a table with the following columns: 記錄 ID (Record ID), 對話 (Conversation), 狀態 (Status), 迭代數 (Iteration), TOKEN 數 (Token Count), and 操作 (Actions). The first three rows of data are visible. The first row has a status of '已完成' (Completed) and a token count of '1,003 in / 50 out'. The second row has a status of '已完成' and a token count of '1,076 in / 124 out'. The third row has a status of '已完成' and a token count of '2,036 in / 181 out'. In the Actions column of the third row, a funnel icon is highlighted with a tooltip that says '以此對話過濾' (Filter by this conversation).

記錄 ID	對話	狀態	迭代數	TOKEN 數	操作
+	請問你們的營業時間和運費怎...	已完成	1	1,003 in / 50 out	🔍 ⚙️
+	你好，我上週買的藍芽耳機右...	已完成	1	1,076 in / 124 out	🔍 ⚙️
+	你好，我上週買的藍芽耳機右...	已完成	2	2,036 in / 181 out	🔍 ⚙️

Click the funnel icon to the right of a record to filter by this conversation

2. Review the filtered results

A banner above the list says **Showing execution records for conversation “...” only**. The list then shows only records from that conversation. The filter remains in place when you change pages or sort the list. The funnel icons for these records turn gray; hovering over them shows **Already viewing records for this conversation**.

To return to the full list, click **Clear** or the close icon (×) on the right side of the banner.

● 僅顯示對話「你好，我上週買的藍芽耳機右耳沒有聲音，想要退貨，該怎麼處理？」的執行記錄

清除 ×

記錄 ID	對話	狀態	迭代數	TOKEN 數	操作
+ [ID]	你好，我上週買的藍芽耳機右...	已完成	1	1,076 in / 124 out	▽ ⓘ
+ [ID]	你好，我上週買的藍芽耳機右...	已完成	2	2,036 in / 181 out	▽ ⓘ

After filtering, the banner identifies the selected conversation and the list shows only its records

Example: Find which assistant answered a customer complaint

A customer service supervisor receives feedback that the return instructions were unclear and wants to find out which assistant handled each reply in that conversation:

Find any record from the conversation under **Execution records** and click **Filter by this conversation**. The list now contains only records from that conversation.

Expand each record. The assistant names on the step cards show that the first message was received by **Demo – Customer Service Routing Assistant** and handed off to **Demo – Returns and Exchanges Assistant**. The latter answered the follow-up directly.

Click the title in the **Conversation** column to open the original conversation and compare the actual replies. Once you confirm the issue came from **Demo – Returns and Exchanges Assistant**, return to **AI assistants** to adjust its settings.

3. Expand step details

Click + to the left of a record (or click the row) to see **which assistant nodes handled the run, in order**. Each step appears on a card:

Item	Description
Step number and name	Shown as #number • name, such as #1 • Demo – Customer Service Routing Assistant, so you can identify the assistant responsible for the step.
Token usage	The right side of the card shows the step's input/output tokens (in out). Some steps also show duration, helping you identify where resources were spent.

記錄 ID	對話	狀態	迭代數	TOKEN 數	操作
+ 	請問你們的營業時間和運費怎...	已完成	1	1,003 in / 50 out	👁️ ⚙️
+ 	你好，我上週買的藍芽耳機有...	已完成	1	1,076 in / 124 out	👁️ ⚙️
- 	你好，我上週買的藍芽耳機有...	已完成	2	2,036 in / 181 out	👁️ ⚙️

#1 · 示範一客服務助理

#2 · 示範一週換貨助理

Step details: each card shows its number and assistant name, with token usage on the right

No records visible? Execution records appear only after a conversation triggers the team. If the list is empty, chat with the team through its conversation platform, then return to this page.

4. Use records to optimize the team

Unexpected routing: If the step cards show that a request went to the wrong assistant, return to [Canvas composition](#) and clarify the connection's **Trigger condition description** to specify when that route should be used.

Too many iterations or a long duration: Assistants may be handing the request back and forth too often. Check for unnecessary connections, or adjust the team's **Maximum iterations** and each node's settings.

Costs concentrated in one assistant: Compare token usage across the step cards to find the assistant consuming the most tokens. Consider using a lighter model or narrowing its knowledge base and tool scope.

AgentOps

AgentOps Overview

What is AgentOps?

AgentOps (Agent Operations) is the AI Assistant operation management module provided by the MaiAgent platform, focusing on testing, evaluating, and monitoring the actual performance of AI Assistants. With AgentOps, you can systematically manage AI Assistant quality and ensure consistently excellent service experiences.

Why Do You Need AgentOps?

Building an AI Assistant is just the first step — continuous monitoring and optimization are essential for long-term success. AgentOps helps you:

Ensure Consistent Quality

- * Establish standardized testing mechanisms
- * Track AI Assistant performance trends
- * Identify and fix quality issues promptly

Improve Operational Efficiency

- * Automate testing processes to save manpower
- * Quickly identify performance bottlenecks
- * Optimize system resources and costs

Data-Driven Decision Making

- * Quantify AI Assistant performance metrics
- * Compare the effectiveness of different settings or models
- * Develop optimization strategies based on actual data

AgentOps Core Features

1. Test Dataset Management

Create and manage test case collections to verify AI Assistant response quality.

Key Features:

- * Create multiple test datasets
- * Manage test cases and expected responses

- * Support search and categorization
- * Team collaboration on test case maintenance

Use Cases:

- * Verify response accuracy after Knowledge Base updates
- * Establish standard testing workflows
- * Collect frequently asked questions as test benchmarks

For details: [Test Dataset Management](#)

2. Automated Evaluation

Use test datasets to run automated evaluations and generate detailed quality reports.

Key Features:

- * One-click batch testing
- * Calculate success rates and response times
- * Generate detailed pass/fail reports
- * Compare performance across different periods or AI Assistants

Use Cases:

- * Regular quality checks
- * Regression testing before and after updates
- * Compare effectiveness of different AI Assistants or models

For details: [Automated Evaluation](#)

3. AI Assistant Monitoring

Monitor AI Assistant operations in real time and analyze every conversation in detail.

Key Features:

- * View input/output message content
- * Track reply time and processing time
- * Monitor token usage and costs
- * Analyze quality scores and user feedback

Use Cases:

- * Real-time system operation monitoring
- * Identify performance issues and anomalies
- * Track costs and usage
- * In-depth analysis of individual conversations

For details: [AI Assistant Monitoring](#)

4. Evaluation Insight Report

After batch testing is complete, the system automatically analyzes the results and generates an improvement recommendations report — no need to manually interpret each scoring data point.

Key Features:

- * Automatically identify problem patterns in test results
- * Suggest handling priorities based on severity and scope of impact
- * Provide concrete improvement directions, not just scores
- * Support multilingual reports

Use Cases:

- * Success rate falls below expectations and you need to know where the problems are
- * A single test run produces many failed cases and you need to decide which to fix first
- * You need to explain the current quality status and improvement plan to your team or management

For details: [Evaluation Insight Report](#)

5. Tool Execution Records

Track the complete history of AI Assistant external tool invocations and quickly pinpoint the cause of tool execution failures.

Key Features:

- * Record input parameters, execution results, duration, and success/failure status for each tool invocation
- * Retain detailed error messages to help pinpoint failure causes
- * Track usage count and success rate for each tool
- * Cover API tools, Text-to-SQL tools, crawler tools, and custom tools

Use Cases:

- * AI Assistant cannot answer questions that require querying external systems
- * Tools fail intermittently and you need to determine whether it's a timeout, authentication, or parameter issue
- * Evaluating whether a tool needs configuration adjustments or replacement

For details: [Tool Execution Records](#)

AgentOps Workflow

Sub-feature Relationship Map

AgentOps has five sub-features divided into two tracks: **Pre-launch** uses test datasets and automated evaluation to establish quality benchmarks, while **Post-launch** uses monitoring and tool records to observe real operations. The two tracks form a cycle by "feeding issues discovered in production back into the test datasets."

1. Test Dataset Management	Create reusable test case collections — the starting point of the entire testing chain.	<u>Test Dataset Management</u>
2. Automated Evaluation	Batch test AI Assistants using test datasets, producing success rates and average response times.	<u>Automated Evaluation & AI Assistant Monitoring</u>
3. Evaluation Insight Report	Automatically analyze evaluation results into problem patterns and improvement suggestions, ranked by priority.	<u>Evaluation Insight Report</u>
4. AI Assistant Monitoring	Inspect real conversations one by one after launch — inputs, outputs, duration, tokens, and scores.	<u>Automated Evaluation & AI Assistant Monitoring</u>
5. Tool Execution Records	Track AI Assistant external tool invocation parameters, results, and failure causes.	<u>Tool Execution Records</u>

Sequence and dependencies of each sub-feature:

Sub-feature	Stage	Prerequisites	Output	Next Step
Test Dataset Management	Pre-launch	Common questions and expected responses	Reusable test case collections	Hand off to Automated Evaluation
Automated Evaluation	Pre-launch	Test datasets, AI Assistant to test	Success rate, average response time, per-case pass/fail	Hand off to Evaluation Insight Report for analysis
Evaluation Insight Report	Pre-launch	A completed automated evaluation	Problem patterns, priorities, concrete improvement directions	Adjust Knowledge Base or role instructions based on suggestions, then test again
AI Assistant Monitoring	Post-launch	Real conversations from a live AI Assistant	Input/output, duration, token usage, scores for each conversation	Feed discovered issues back into test datasets
Tool Execution Records	Post-launch	AI Assistant with configured tools	Tool invocation parameters, results, duration, and error messages	Fix tool settings, or add a test case

Two commonly confused points: "Automated Evaluation" tests questions from the test datasets, while "AI Assistant Monitoring" examines conversations actual users have had — the former is a pre-launch quality gate, the latter is post-launch observation. "Evaluation Insight Report" is not a standalone feature — it is an extension of Automated Evaluation: you must first complete a batch test before an insight report is available.

Standard Quality Management Flow

1. Create Test Datasets
↓
Collect common questions and expected responses
Build structured test cases
2. Run Automated Evaluations
↓
Run tests regularly or after updates
Generate success rate and quality reports
3. Analyze Evaluation Results
↓
Identify failed cases
Find issues that need improvement
4. Optimize AI Assistant
↓
Update Knowledge Base content
Adjust AI settings and prompts
5. Monitor Actual Operations
↓
Use AI Assistant Monitoring to track real conversations
Continuously ensure quality stability
6. Continuous Improvement
↓
Discover new issues from monitoring data
Update test datasets
Repeat the evaluation and optimization cycle

Quick Start Steps

Week 1: Build Foundational Tests

1. Collect 20-30 frequently asked questions
2. Create your first test dataset

3. Run the initial automated evaluation
4. Record the current success rate as a baseline

Week 2: Continuous Optimization

1. Analyze failed test cases
2. Update the Knowledge Base or adjust AI settings
3. Re-run evaluations to verify improvements
4. Start using AI Assistant Monitoring to observe real conversations

Week 3: Build Habits

1. Run automated evaluations once a week
2. Check monitoring data daily to identify anomalies
3. Continuously add test cases to cover more scenarios
4. Create quality reports to track long-term trends

AgentOps Integration with Other Features

AgentOps + Knowledge Base Management

Integration Use Cases:

- * Run automated evaluations immediately after Knowledge Base updates
- * Supplement Knowledge Base content when monitoring data reveals knowledge gaps
- * Create test cases based on real conversations to optimize the Knowledge Base

Related documentation: [Build an Enterprise Knowledge Base](#)

AgentOps + Usage Analytics

Complementary Analysis:

- * **Usage Analytics:** Provides overall trends and statistics (conversation volume, satisfaction, etc.)
- * **AgentOps:** Provides in-depth quality analysis and individual conversation details

Combined use enables you to:

- * Detect anomalies from overall trends
- * Identify root causes from monitoring details
- * Comprehensively evaluate AI Assistant performance

Related documentation: [Usage Analytics](#)

AgentOps + Response Quality Control

Integration Use Cases:

- * AgentOps provides technical quality monitoring

- * Response Quality Control provides manual review and annotation
- * Together they form a complete quality assurance system

Related documentation: [Response Quality Control](#)

Best Practices

1. Establish a Regular Evaluation Schedule

Daily Check (5 minutes):

- * Review AI Assistant Monitoring to identify anomalies

Weekly Evaluation (30 minutes):

- * Run core test datasets
- * Check whether success rates remain stable
- * Update or add test cases

Monthly Analysis (2 hours):

- * Run a full evaluation
- * Export monitoring data for in-depth analysis
- * Produce quality reports
- * Plan optimization goals for the next month

2. Set Quality Baselines

Set reasonable quality targets for your AI Assistant:

Metric	Baseline	Target	Description
Automated Evaluation Success Rate	≥ 85%	≥ 95%	Standard test case pass rate
Average Response Time	< 5 seconds	< 3 seconds	User-perceived response speed
User Satisfaction	≥ 80%	≥ 90%	Like total feedback ratio
Token Usage	-	-	Set limits based on budget

3. Establish an Issue Tracking Workflow

When quality issues are discovered:

```
Issue Discovered
↓
Record in test dataset (prevent recurrence)
↓
Analyze root cause (Knowledge Base
  AI settings
  model capability)
↓
Implement improvements
↓
Run evaluations to verify effectiveness
↓
Continue monitoring to confirm stability
```

4. Team Collaboration

Establish AgentOps responsibility assignments:

AI Manager:

- * Overall quality monitoring
- * Develop optimization strategies
- * Regular evaluations and reporting

Knowledge Base Administrator:

- * Update the Knowledge Base based on evaluation results
- * Supplement missing knowledge content

Technical Staff:

- * Analyze performance issues
- * Optimize system settings
- * Handle technical anomalies

5. Continuous Improvement Cycle

The core of AgentOps is continuous improvement:

Measure: Obtain data through evaluations and monitoring

Analyze: Identify issues and improvement opportunities

Act: Implement optimization measures

Verify: Confirm improvement effectiveness

Standardize: Incorporate successful practices into workflows

Q1: What is the difference between AgentOps and "Usage Analytics"?

Usage Analytics:

- * Overall trends and statistics (conversation volume, word count, satisfaction)
- * Suitable for understanding AI Assistant usage overview
- * Focuses on business metrics

AgentOps:

- * In-depth quality analysis and individual conversation details
- * Suitable for technical quality management
- * Focuses on technical metrics (success rate, response time, cost)

The two are complementary — we recommend using them together.

Q2: How often should evaluations be run?

Recommended frequency:

- * **Core features:** Once a week
- * **Full tests:** Once a month
- * **After major updates:** Run immediately
- * **When issues are found:** Test and verify at any time

Adjust based on your AI Assistant's importance and update frequency.

Q3: How many test cases should a test dataset contain?

Recommended amounts:

- * **Minimum:** 20 test cases (covering core features)
- * **Recommended:** 50-100 test cases (balancing coverage and efficiency)
- * **Comprehensive:** 200+ test cases (for large or critical systems)

Start with core features and expand gradually.

Q4: What success rate is considered acceptable?

It depends on the AI Assistant's purpose:

- * **High-risk applications** (finance, healthcare): $\geq 95\%$
- * **Customer support:** $\geq 90\%$
- * **General conversation:** $\geq 85\%$
- * **Experimental features:** $\geq 80\%$

The key is to establish a baseline and continuously improve.

Q5: Does AgentOps affect real users?

No. AgentOps testing and monitoring run in isolated environments or in the background, without interfering with the actual user experience.

Q6: Can I create multiple test sets for different business areas?

Yes. We recommend creating multiple test datasets for different business areas or features:

- * Product inquiry test set
- * Order processing test set
- * Technical support test set
- * ...and more

This allows you to track quality performance separately for each area.

Get Started with AgentOps

Ready to start using AgentOps? We recommend following this order:

Create Test Datasets: Collect common questions and create your first test set

Run Automated Evaluations: Test your AI Assistant and review success rates and response times

Read the Evaluation Insight Report: Understand where the problems are and what to prioritize

Use AI Assistant Monitoring: Gain in-depth understanding of actual operations after launch

View Tool Execution Records: If your AI Assistant has configured tools, track whether tool invocations are working properly

With AgentOps, you can establish a systematic quality management workflow to ensure your AI Assistant consistently delivers excellent service.

Test Dataset Management

What Is a Test Dataset?

A test dataset is a collection of pre-prepared test cases used to validate the response quality and accuracy of AI assistants. By creating standardized test datasets, you can:

Ensure Response Quality

- * Verify that the AI assistant's responses to common questions meet expectations
- * Ensure responses don't degrade after knowledge base updates
- * Continuously track response quality trends

Improve Efficiency

- * Batch test multiple questions without manual verification one by one
- * Create reusable test cases to save testing time
- * Quickly identify issues and make timely adjustments

Team Collaboration

- * Centrally manage all test cases
- * Different team members can jointly maintain test data
- * Track who created and last updated test cases

How to Access Test Dataset Management

Go to "**AgentOps**" in the left sidebar, then click "**Test Datasets**" to see the test dataset management page.

Test dataset management interface

The page displays the following information:

- * **Test Dataset ID:** A unique identifier automatically generated by the system
- * **Test Dataset Name:** The name you assigned to the dataset
- * **Test Case Count:** The total number of test cases in the dataset
- * **Created By:** The user who created this dataset
- * **Created At:** The date and time the dataset was created
- * **Last Updated:** The time the dataset was last modified
- * **Action Buttons:** Edit, delete, and other functions

Creating a Test Dataset

1. Start Creating

Click the "**Create Dataset**" button in the upper right corner to start creating a new test dataset.

2. Set Basic Information

In the dialog that appears, enter the following information:

Test Dataset Name (required)

- * Use a meaningful name, such as: "Product Query Test Set" or "Customer Service FAQ Test"
- * This makes it easier to manage and identify purposes later

Test Dataset Description (optional)

- * Describe the purpose and coverage of this test set
- * Example: "For testing product specification query functionality, containing 50 common product questions"

Select AI Assistant (required)

- * Choose the AI assistant to test
- * A test dataset can correspond to one or more AI assistants

3. Add Test Cases

After creating the test dataset, you need to add test cases. Each test case contains:

Test Question

- * Questions that users might ask
- * Recommended to cover various phrasings and scenarios

Expected Response

- * How the AI assistant should answer
- * Can be keywords, sentences, or complete paragraphs
- * The system compares whether the actual response contains the expected content

Test Case Examples:

Question: What is your return policy?

Expected Response: Unconditional returns within 7 days of purchase, items must remain new and unused

Question: How do I apply for a refund?

Expected Response: Apply for a refund through the order management page in the member center, refund will be processed within 3-5 business days after approval

Question: Who pays for return shipping?

Expected Response: We cover shipping for defective products, buyers cover shipping for personal preference returns

Managing Test Datasets

Search Test Datasets

Use the search bar at the top of the page to quickly find target datasets by:

- * Test dataset ID
- * Test dataset name
- * Description keywords

After entering keywords, the system filters and displays matching datasets in real time.

Edit Test Datasets

Click the "**Edit**" button in the action column to:

- * Modify the test dataset name and description
- * Add, edit, or delete test cases
- * Adjust the order of test cases

Regularly review and update test cases to ensure test content stays aligned with actual business needs

Delete Test Datasets

Click the "**Delete**" button in the action column to delete test datasets that are no longer needed.

Deleted test datasets cannot be recovered. Proceed with caution. If the dataset has been used in automated evaluations, the related evaluation records will be retained, but the same test cannot be run again.

Test Dataset Best Practices

1. Create Structured Test Categories

Group test cases by business needs:

Product-related knowledge base tests:

- Product Query Test Set (50 cases)
- Price Inquiry Test Set (30 cases)
- Inventory Verification Test Set (20 cases)

Customer service workflow tests:

- Order Processing Test Set (40 cases)
- Return & Exchange Workflow Test Set (35 cases)
- Membership Service Test Set (25 cases)

2. Cover Multiple Phrasings

The same concept can be phrased in different ways. Include various phrasings in your test cases:

Formal phrasing: Could you please tell me your business hours?

Colloquial phrasing: What time do you open?

Short phrasing: Business hours

Full sentence: I'd like to know what your business hours are, from when to when

3. Include Edge Cases

Test extreme situations and ambiguous questions:

- * Incomplete questions: "price," "what do I do"
- * Questions with typos: "prodcut specs"
- * Compound questions: "How much does it cost? Can I return it? What colors are available?"
- * Out-of-scope questions: Test how the AI assistant responds

4. Regularly Update Test Data

When new features launch: Add corresponding test cases

After knowledge base updates: Check whether related test cases need adjustment

When issues are discovered: Immediately add test cases for that scenario to prevent recurrence

Regular reviews: Review test cases monthly or quarterly to ensure they still reflect current conditions

5. Set Appropriate Test Quantities

Recommended test cases per dataset:

- * **Minimum 20 test cases:** Ensures coverage of basic scenarios
- * **Recommended 30-50 test cases:** Balances test coverage and execution time
- * **100+ cases for special situations:** Suitable for complex business logic

Frequently Asked Questions

Q1: What is the relationship between test datasets and automated evaluations?

Test datasets are the foundation of automated evaluations. You need to create a test dataset first, then select the test dataset and AI assistant in the "Automated Evaluation" feature. The system automatically runs the tests and generates an evaluation report.

For more information, see: [Automated Evaluations](#)

Q2: Can one test dataset be used to test multiple AI assistants?

Yes. You can select the same test dataset with different AI assistants during automated evaluation to compare how different AI assistants perform on the same test cases.

Q3: Does the expected response need to match exactly?

No. The system checks whether the AI assistant's actual response "contains" the key content of the expected response. You can set keywords or important sentences, and the test passes as long as the actual response includes that content.

Q4: How do I import a large number of test cases?

Currently, you can batch-add test cases by copying and pasting. Future versions will support Excel or CSV file import — stay tuned.

Q5: Can test datasets be shared with other organization members?

Yes. All members within the same organization can view and use test datasets. You can identify who created a dataset through the "Created By" column to facilitate team collaboration.

Q6: If I delete an AI assistant, will the related test datasets disappear?

No. Test datasets are managed independently. Even if you delete an AI assistant, the test datasets are retained. You can use the same test dataset to test other AI assistants.

Next Steps

After creating test datasets, you can:

- * Go to [Automated Evaluations](#) to run tests and view results
- * Use [AI Assistant Monitoring](#) to track the AI assistant's actual operational performance
- * Adjust knowledge base content or AI assistant settings based on evaluation results

Automated Evaluation & AI Assistant Monitoring

Automated Evaluation

The automated evaluation feature allows you to use pre-built test datasets to automatically test AI Assistant response quality. The system sends test questions to the AI Assistant, compares actual responses with expected responses, and generates detailed evaluation reports.

Access Automated Evaluation

Go to "AgentOps" in the left sidebar, then click "Automated Testing".

[illegible]

Automated testing list showing success rate and average response time for each test run

The page displays all evaluation records, including evaluation name, test dataset, AI Assistant, success rate, average response time, and creation time.

Create and Run a Test

Ensure you have created a test dataset (refer to [Test Dataset Management](#))

Click the "[Create Test](#)" button

Fill in the evaluation name and description, then select the test dataset and AI Assistant

Click "[Start Evaluation](#)" and the system will automatically execute all test cases

Evaluation execution time depends on the number of test cases. Typically, 50 test cases take approximately 2-3 minutes.

Use Custom Evaluation Metrics

In addition to built-in metrics, you can define your team's own scoring criteria using natural language. For example, Mai, a customer service manager, wants to verify whether the customer service assistant remains polite and empathetic. She creates a "Customer Service Tone" metric, enters the evaluation criteria, and sets a passing threshold. After the evaluation is complete, she can view each case's "Customer Service Tone" score in the results and identify responses that need adjustment.

When creating an evaluation, complete the basic settings, including the name, test dataset, AI Assistant, and evaluation model.

In the "[Custom Metrics](#)" section, click "[Add Custom Metric](#)", then enter an easily identifiable metric name and evaluation criteria.

Adjust the passing threshold according to your team's quality standards, then click "[Confirm](#)" to start the evaluation.

Set evaluation criteria for customer service tone using natural language

The system compares names without regard to letter case. A custom metric cannot duplicate any of the 11 built-in metrics. If a name conflicts, use a name that expresses your team's evaluation objective.

Evaluate Multi-turn Conversations

Multi-turn evaluation is ideal for testing tasks that require back-and-forth confirmation. For example, Mei, a quality manager, wants the assistant to ask for the order number first, confirm the reason for the return, and then explain the next steps. She creates a multi-turn test case, enters the scenario and expected result, and runs the evaluation. When it is complete, she can expand the conversation transcript to review every response and the Knowledge Base content retrieved during each turn, instead of looking only at the final answer.

First, go to "[Test Datasets](#)" and open the target test dataset. Add a scenario, expected result, and simulated user persona to the multi-turn test case.

Return to "[Automated Testing](#)", click "[Create Evaluation](#)", and switch to "[Multi-turn Conversation](#)".

Select the test dataset, AI Assistant, and evaluation model. Set the maximum number of turns, evaluation metrics, and simulation language, then start the evaluation. At least one evaluation metric must be enabled.

After the evaluation is complete, open the results and select an individual case to expand its details. Review the metric scores, conversation transcript, and "[Retrieved Content](#)" for each turn. If an individual case fails, its error is displayed separately without hiding the results of other cases.

Turn Relevancy 1.00

Turn Faithfulness 1.00

Conversation Completeness 0.00

已通過 未通過

顧客要退還所訂單車頭燈袋，助理需先取得訂單編號與原因。
預期結果：助理應先查詢單車頭燈袋詳情並提供協助。

Turn Relevancy 1.00
得分原因：0.00
The score is 1.0 because there were no listed irrelevant or irrelevant messages containing information that is irrelevant to the user's requests.

Turn Faithfulness 1.00
得分原因：0.00
The score is 1.0 because all evaluated claims were consistent with the retrieved truth, and no contradictions, unsupported statements, false claims, or image-related errors were found.

Conversation Completeness 0.00
得分原因：0.00
The score is 0.0 because the AI response only said 「您好，請提供所退還的單車頭燈袋，並提供所退還單車頭燈袋的原因。」 and 「請提供所退還單車頭燈袋的單車頭燈袋編號。」，It therefore rather overplayed the requested return using the provided order number and reason rather than fully follow the requested information.

對話語句 (4)

助理問：您好，目前加購還沒有提供「單車頭燈袋申請」按鈕，也沒有列出需要準備的資料。

預期結果：請向顧客提供 MalAgent 系統管理建議。若您是 MalAgent 客戶，也可透過平台向客體諮詢。資料詳情：sales@malagent.ai。[1]

預期結果：您好，請提供一個訂單申請編號，以便為您提供所退還資料？

Expand a case to review the assistant's response and the Knowledge Base content used in each turn

If you no longer need an ongoing multi-turn evaluation, click "**Cancel Evaluation**" in the evaluation details and confirm. The system stops processing subsequent cases after the current case is complete. Scores and transcripts for completed cases are retained, the status is shown as "**Partially Completed**", and unprocessed cases are shown as "**Pending Evaluation**".

Completed cases are retained after cancellation, while unprocessed cases remain pending evaluation

View Evaluation Results

Click on an evaluation record to view the detailed report:

Test details page: success rate, AI insights summary, metric statistics, and improvement suggestions

The detailed report includes:

- Success Rate:** Percentage of test cases that passed
- AI Insights:** Automatically generated evaluation summary and improvement suggestions
- Metric Statistics:** Quality scores, response relevance, and other metrics
- Test Case Details:** Expected response, actual response, score, and status for each question

Success Rate Reference Benchmarks:

AI Assistant Type	Recommended Success Rate
Product Inquiry Assistant	≥ 95%
Customer Support Assistant	≥ 90%
General Conversation Assistant	≥ 80%

For more information about insight reports, refer to: [Evaluation Insight Reports](#)

Manage Evaluation Records

Search and Filter: Filter records by test dataset, AI Assistant, or keywords

Re-run: After modifying the Knowledge Base or AI settings, re-run tests to verify improvements

Export: Export evaluation results in Excel format

Edit the Evaluation Name and Description

After a test is complete, you can still edit its evaluation name and description without deleting or rerunning the test. The test dataset, AI Assistant, evaluation results, and execution status remain unchanged.

For example, after Mai created a weekly customer service quality test, she noticed that the week number in the evaluation name was incorrect. She opened the edit dialog from the automated testing list, corrected the name, and added the test objective. After she saved the changes, the list immediately displayed the updated information while retaining the original test results.

Open the Automated Testing List

From the left menu, go to “AgentOps” → “Automated Testing” .

Open the Edit Dialog

Find the evaluation you want to update, then click the “Edit” icon in the “Actions” column for that row.

Edit and Save

Edit the “Evaluation Name” or “Description” , then click “Confirm” . The evaluation name is required and can contain up to 200 characters; the description may be left blank.

The edit dialog is prefilled with the current evaluation name and description

You can edit the name and description of evaluations that are running, completed, or failed. This action only updates the identifying information and does not rerun the test.

AI Assistant Monitoring

AI Assistant Monitoring provides real-time conversation operational data, allowing you to gain deep insight into the processing details, performance metrics, and quality scores of each conversation.

Access AI Assistant Monitoring

Go to "[AgentOps](#)" in the left sidebar, then click "[AI Assistant Monitoring](#)".

Field	Description
Total Token Count	Total tokens consumed in the conversation (including question and answer)
LLM	The name of the language model used
User	The user who initiated the conversation
Source	Whether the record is an Interactive Conversation (a user asks a question) or a Scheduled Run (automatically triggered by an agent schedule)
Member	The organization member who initiated the conversation; displays “—” when no member is associated with it (for example, a scheduled run)

View Image Search Usage

When an AI Assistant uses image search in the Knowledge Base, the system separately records image embedding usage. You can review an individual conversation record to see which resources were used for that response:

Go to **AgentOps** → **AI Assistant Monitoring**, then switch to **Conversation Records**.

Find the response you want to review, then click **Details** on the far right.

Scroll down to view the Token and Credit breakdown. Standard text embedding is listed under **Embedding**. If the response used image search, **Image Embedding** is also displayed, and the Token and Credit totals include this item.

Usage breakdown for an individual conversation; “Image Embedding” appears only when the response actually used image search

If **Image Embedding** is not displayed, it does not mean the record is missing. This item appears only when the response actually incurs image embedding usage. When image search is not used, the screen continues to show the standard embedding breakdown.

For example, Mai's customer service manager asks the product assistant to identify the appearance of a component from catalog images. After testing, she opens the conversation details and sees the image embedding usage and corresponding Credits. This allows her to distinguish the cost of image search from standard text retrieval before deciding whether to adjust the image catalog or assistant settings.

Search and Filter

Keyword Search: Search input/output messages or usernames

LLM Filter: Select a specific language model to compare performance across different models

AI Assistant Filter: Select a specific assistant to track its operational status

Time Range: Select last 7 days, 30 days, 90 days, or a custom date range

Export: Export monitoring data in Excel or CSV format

Source Filter: Show only **Interactive Conversations** or **Scheduled Runs**

Member Filter: Select one or more organization members and show only conversations they initiated

Filter Conversation Records by Member and Source

The filter bar in **Conversation Records** includes **All Sources** and **All Members** dropdowns by default. The list also has **Source** and **Member** columns, so you can see who asked a question and whether a person or a schedule initiated the run.

For example, a customer service manager wants to understand how a new colleague has used the internal AI Assistant over the past few weeks. She opens Conversation Records, sets **Source** to **Interactive Conversation** to exclude scheduled records, and selects the colleague under **All Members**. The list now shows only that colleague's conversations. After reviewing them, she clicks **Export** to share the same list with the training team without asking an engineer to retrieve the data.

1. Filter by Member

Go to **AgentOps** → **AI Assistant Monitoring** in the left menu, switch to **Conversation Records**, and click **All Members**. Select the members you want to view; you can select multiple members or search by keyword.

Select members from the All Members dropdown (member names and email addresses are obscured)

The list then shows only conversations initiated by those members. You can combine this filter with keyword, AI Assistant, error status, date, and other filters. The **Member** column on the right shows the member associated with each record.

Limitations when “Scheduled Run” is selected Scheduled runs have no associated member or user feedback, so the **Member** and **Rating** filters are disabled and cleared. **Export** currently supports only interactive conversations. When the source is **Scheduled Run**, the button is disabled. Clear the source filter before exporting. **Dashboard** statistics include only interactive conversations. View scheduled runs in **Conversation Records**.

Click **Details** on a scheduled run record. **Basic Information** shows the **Schedule Name**, **Source**, and **Status** for that run. **Identification Information** also shows the **Schedule ID**, so you can identify which schedule created the record.

基本資訊

排程名稱	來源	狀態
示範排程-每日回應範本	排程執行	成功
AI 助理	模型	建立時間
示範-資料回應術演	Claude 5 Sonnet	2026-09-29 01:44:21
回應時間		

Basic information for a scheduled run record shows the schedule name, Source as Scheduled Run, and Status as Success

Export Requests

After you click **Export** in **Conversation Records**, the system creates an Excel file in the background using the current filters (including member and source) and displays “Export request created, processing...” . Go to **AgentOps** → **Export Requests** in the left menu to view each export's **Status**, the **User** who requested it, **Record Count**, **File Size**, **Processing Time**, and creation or completion time. Once the status is **Completed**, you can download it from the **Actions** column.

ID	狀態	使用者	記錄數	檔案大小	處理時長	建立時間	操作
	已處理		79	242.24 KB	7.95秒	2026-09-29 01:44:21	↓ 🗑️

The export requests list shows status, requesting user (obscured), record count, and file size

When multiple administrators share an organization, use the **User** column to identify who created each export before deciding which file to download or delete.

Dashboard Metrics and Error Rate

Switch to the “**Dashboard**” tab to view overall service metrics and their percentage changes compared with the preceding period of the same length:

Metric	Description
Conversations	The number of responses from AI Assistants during the selected period. Each AI response in a conversation counts once; responses handled by human agents and automatically scheduled runs are excluded (see the definition below for details)
Error Rate	Percentage of responses with system errors (see the calculation below)
Average Response Time	Average time from receiving a message to completing the response
Average TTFT	Average time from when a user sends a message until the first token appears

The dashboard also provides charts for conversation volume, response time, error-rate trends, and LLM model distribution. The “Assistant Service Ranking” compares error rates and response speeds across assistants.

Dashboard metric cards and trend charts

How Is the Conversation Count Calculated?

The dashboard's "Conversations" metric and conversation volume trend count **each response from an AI Assistant**, rather than the number of conversations opened:

Scenario	Counted?	Count
A user enters the service but does not send a message	No	0
A user sends 1 message and the AI responds once	Yes	1
In the same conversation, a user asks 5 questions and the AI responds 5 times	Yes	5
A user sends a message, but a human agent takes over and responds	No	0
A user sends a message, but an error occurs while the AI is responding	Yes	1
An automatically scheduled task runs	No	0

To see how many conversations were opened, view "Conversation Count" on the AI Assistant's "Usage Analytics" page instead. It counts 1 when a user sends the first message, regardless of how many turns the conversation contains, and includes conversations handled by human agents. These metrics have different definitions, so the dashboard's "Conversations" count is generally higher than the "Conversation Count" in "Usage Analytics." See [Usage Analytics](#) for details.

How Is the Error Rate Calculated?

Error rate = Number of responses with system errors ÷ Total number of responses × 100%

Only **system-level** errors are counted, such as model call failures and timeouts. The following are **not counted** as errors to avoid overestimating the error rate:

Responses interrupted by the user (Client Interrupt)

Normal blocking by content safeguards (Hook)

The error rate measures service stability, not response quality. If the error rate rises abnormally, review the assistant's conversation records to identify the cause, such as model issues or external tool integration failures. To assess response quality, review faithfulness and answer relevance scores together with users' thumbs-up and thumbs-down feedback.

Monitoring Best Practices

Daily Review: Check conversations from the last 24 hours to identify abnormal response times or errors

Identify Performance Bottlenecks:

- * Response time > 10 seconds: Check Knowledge Base retrieval efficiency or consider a faster LLM
- * High token usage: Evaluate whether the System Prompt or conversation history can be shortened

Quality Issue Tracking:

1. Use keyword search to find problematic conversations
2. Analyze root causes (insufficient Knowledge Base AI misunderstanding model limitations)
3. Add problem cases to the test dataset and run automated evaluations to verify fixes

FAQ

Q: What is the difference between Automated Evaluation and AI Assistant Monitoring?

	Automated Evaluation	AI Assistant Monitoring
Purpose	Periodic quality testing	Real-time operational monitoring
Data Source	Predefined test datasets	Actual user conversations
Key Metrics	Success rate, response time	Performance, cost, quality scores
Best For	Quality verification, regression testing	Daily monitoring, troubleshooting

Q: How often should evaluations be run?

Recommendation: Core features weekly, full tests monthly, and immediately after major updates.

Q: Do evaluations affect actual users?

No. Automated evaluations run in an isolated environment and do not interfere with actual user conversations.

Q: How long is monitoring data retained?

The default retention period is 90 days. You can periodically export important data for long-term storage.

Evaluation Insights Report

This guide explains how to use the Evaluation Insights feature to quickly understand your AI assistant's test results and receive system-generated improvement recommendations.

What Are Evaluation Insights?

Evaluation Insights is an extension of AgentOps automated testing. After completing a batch test, the system not only displays metric scores but also automatically analyzes test results and generates an "Insights Report."

This report tells you:

How the test results performed overall

Where the main issues are

How to make specific improvements

Which items to prioritize

Think of it as having a senior consultant review your test report and provide you with an improvement recommendation document.

Core Advantages of Evaluation Insights

Automated Analysis

No need to manually interpret complex scoring data — the system automatically identifies problem patterns and compiles them into an easy-to-understand report.

Priority Recommendations

The system recommends which items to address first based on issue severity and scope of impact, making your improvement efforts more efficient.

Specific Improvement Directions

It doesn't just tell you "there's a problem" — it also provides concrete improvement suggestions, such as which settings to adjust and what content to supplement.

Multi-Language Support

Insights reports support multiple languages including Traditional Chinese, Simplified Chinese, and English. You can choose the language that best suits your team's needs.

How to Use the Evaluation Insights Feature

Step 1: Complete a Batch Test

Go to "AgentOps" → "Automated Testing"

Run a batch test (refer to [AgentOps User Guide](#))

Wait for the test to complete

[illegible]

Automated testing list showing success rate and average response time for each test

Step 2: View Evaluation Results

Go to the test result detail page

Review each scoring metric

Find the "Insights Report" section

Test detail page: includes success rate, AI insights summary, metric statistics, and improvement suggestions

Step 3: Select the Report Language

In the Insights Report section, you can choose the display language for the report:

Traditional Chinese: Suitable for Taiwan-based teams

Simplified Chinese: Suitable for Mainland China-based teams

English: Suitable for international teams or situations requiring English reports

After selecting a language, the system automatically generates the insights report in the corresponding language.

Step 4: Read the Insights Report

The insights report typically includes the following content:

1. Overall Evaluation Summary

Test pass rate

Key strengths

Areas needing improvement

2. Issue Analysis

Answer relevance issues

Safety risks (bias, offensiveness, hallucinations)

Response speed issues

3. Improvement Suggestions

Priority items (labeled as "High Priority," "Medium Priority," or "Low Priority")

Specific improvement steps

Expected improvement outcomes

Step 5: Make Improvements Based on Suggestions

Address issues in order of the priority listed in the report

Adjust AI assistant settings based on the specific improvement steps

After making adjustments, run the test again to verify the results

How Evaluation Insights Are Calculated

The system considers the following factors to generate the insights report:

Scoring Metrics: The levels and distribution of each score

Failed Cases: The number and reasons for failed cases

Problem Patterns: The frequency of recurring similar issues

Best Practices: Industry standards and optimization recommendations

Generating the insights report requires some processing time, typically completed within 1-2 minutes after the test finishes.

Practical Use Cases

Medical Clinic Customer Service

Test Results:

* Pass rate: 72%

* Hallucination score: High

Insights Report Suggestion:

"The test found that some responses contained unverified medical advice. It is recommended to explicitly restrict the role instructions: 'Do not provide diagnostic or treatment advice; only provide appointment scheduling and clinic information.'"

Enterprise Internal Knowledge Management

Test Results:

* Pass rate: 88%

* Answer relevance: Low

Insights Report Suggestion:

"The test found that some responses were too brief or did not fully answer the question. It is recommended to add more detailed operating steps and examples to the knowledge base."

FAQ

Q1: Can the insights report be downloaded?

Currently, the insights report can only be viewed within the system. You can copy the report content and compile it into an internal document.

Q2: Does the insights report update automatically with new test results?

Yes, each time a new batch test is run, the system generates a new insights report reflecting the latest test results.

Q3: Can I switch the language of the insights report?

Yes, you can switch the report language at any time, and the system will regenerate the report in the selected language.

Q4: Do I have to implement all the suggestions in the insights report?

Not necessarily. You can prioritize "High Priority" items based on actual needs and available resources. The system's suggestions are reference directions — you can adjust them according to your business requirements.

Q5: Why didn't my test generate an insights report?

Possible reasons:

- * Too few test cases (at least 10 are recommended)
- * The test has not finished yet
- * The system is still processing (please wait 1-2 minutes)

Tool Execution Records

Overview

Tool execution records let you track the complete history of an AI assistant's external tool invocations, including API calls, database queries, web scraping operations, and more. When an AI assistant needs to perform tasks beyond the scope of conversation, it uses tools to do so. Tool execution records help you understand tool usage, identify causes of execution failures, and optimize tool configurations.

With comprehensive execution records, you can identify the root cause of tool failures within 5 minutes, reducing troubleshooting time by 80% and ensuring the AI assistant can reliably deliver advanced functionality.

Features

With the tool execution records feature, you can:

Complete Execution History

The system automatically records every tool invocation, including input parameters, execution results, duration, and success or failure status.

Use case: An e-commerce platform's order query tool is invoked 500 times daily and needs success rate and response time tracking

Actual benefit: Discovered 10% of queries failed due to timeouts; after adjusting timeout settings, the success rate improved to 98%

Quickly Identify Failure Causes

When a tool execution fails, the system records detailed error messages to help you quickly understand what went wrong.

Use case: A weather query API suddenly starts failing frequently and the cause needs to be identified quickly

Actual benefit: Error records revealed an expired API key; service was restored within 5 minutes of updating it

Tool Usage Statistics

View invocation counts, success rates, average execution times, and other statistics for each tool.

Use case: An enterprise has configured 10 tools and wants to know which are used most frequently and which have the most issues

Actual benefit: Discovered 3 tools were never used; removing them reduced system complexity, and other tools saw a 15% improvement in response speed

Optimize Tool Configurations

Based on execution record analysis, adjust tool parameters, optimize invocation logic, and improve error handling.

Use case: A database query tool frequently times out because the query scope is too large

Actual benefit: After adjusting query limits based on record analysis, average execution time dropped from 8 seconds to 3 seconds

Tool Types

MaiAgent supports multiple tool types, and tool execution records track the execution status of all types:

API Tools

Call external APIs to retrieve real-time data, such as weather queries, exchange rate queries, inventory queries, etc.

Common execution issues:

- * Expired or invalid API keys
- * Incorrect request parameter formats
- * API service timeout or no response
- * Exceeded API call limits

Text-to-SQL Tools

Convert natural language questions into SQL queries to retrieve data from databases.

Common execution issues:

- * SQL syntax errors
- * Query scope too large causing timeouts
- * Database connection failures
- * Insufficient permissions to access specific tables

Web Scraping Tools

Scrape real-time information from specified websites, such as latest news, product prices, etc.

Common execution issues:

- * Target website unreachable
- * Web page structure changes causing parsing failures
- * Blocked or rate-limited by the target website
- * Scraping timeout

Custom Tools

Enterprise-developed tools for specific functions, such as order processing, member verification, etc.

Common execution issues:

- * Internal service errors
- * Parameter validation failures
- * Business logic errors
- * System integration issues

Usage Steps

Step 1: Access Tool Execution Records

Enter the admin dashboard and click [AgentOps](#) → [Tool Execution Records](#) in the left sidebar

View the list of recent tool execution records

ID	Tool Name	User	Execution Content	Status	Action
68399955-102-418	WebAgent-小助手	Mr. Agent-MUP	why you don't get hit on News...	成功	🔍
43427107-142-400	WebAgent-小助手	Mr. Agent-MUP	why you don't get hit on News...	成功	🔍
68704603-102-418	WebAgent-小助手	Mr. Agent-MUP	why you don't get hit on News...	成功	🔍
27782916-102-418	WebAgent-小助手	Mr. Agent-MUP	why you don't get hit on News...	成功	🔍
4125138-888-441	WebAgent-小助手	Mr. Agent-MUP	why you don't get hit on News...	成功	🔍

Tool execution records list page

Step 2: Filter Records

Use filter criteria to find execution records that need attention:

Time range:

Today, Last 7 days, Last 30 days

Or custom start and end dates

Tool type:

All tools

API tools

Text-to-SQL

Web scraping tools

Custom tools

Execution status:

All

Success

Failure

In progress

Specific tool:

Select a specific tool name from the dropdown

Click "Apply Filters" to view matching records

Priority Items to Check Recommended priorities: 1. Failed execution records 2. Records with execution time exceeding 10 seconds 3. Execution status of frequently used tools

Step 3: View Execution Details

Click any record in the list

Expand the detailed information, including:

Basic Information:

- * Tool name
- * Execution time (when it was invoked)
- * Execution duration (how many seconds it took)
- * Execution status (Success/Failure)

Input Parameters:

- * Parameter content passed by the AI to the tool
- * Check whether parameters are correct

Execution Result:

- * Complete result returned by the tool
- * Shows retrieved data on success
- * Shows error message on failure

Associated Conversation:

- * The conversation record that triggered this tool invocation
- * Trace back to the user's original question

Error Message (if any):

- * Detailed error description
- * Error code or exception type
- * Stack trace information (if applicable)

Step 4: Analyze Failure Causes

When you find failed execution records, follow these steps to analyze:

Check the error message:

Read the detailed error description

Identify whether it's a configuration issue, permission issue, or service error

Check input parameters:

Confirm whether the parameters passed by the AI are correct

Verify the parameter format meets tool requirements

Review the associated conversation:

Understand what question the user asked

Determine whether a specific question type caused the failure

Compare with successful cases:

Find successful execution records for the same tool

Compare the differences between successful and failed cases

Step 5: Optimize Tool Configuration

Based on execution record analysis, take improvement actions:

Update tool settings:

Correct incorrect API keys or connection information

Adjust timeout settings

Optimize query parameters or constraints

Adjust AI prompts:

If parameters are frequently incorrect, add clear guidance in the prompt

Explain the correct usage and parameter format of the tool

Improve error handling:

Add user-friendly error messages for common error scenarios

Set up automatic retry mechanisms

Remove unused tools:

If a tool has not been used for a long time, consider removing it to simplify the configuration

Step 6: Export Execution Records

Click the "Export" button on the tool execution records page

Select the export format (CSV or Excel)

Select the time range and filter criteria

Download the report for further analysis or archiving

Exported records can be used for: In-depth data analysis and trend tracking
Reporting issues to the technical team
Regular reviews of tool usage efficiency
Compliance auditing and record keeping

Use Cases

Case 1: Diagnosing Tool Failures

Scenario: An e-commerce platform's inventory query tool suddenly starts failing in large numbers, and customer service cannot check product inventory for customers.

Steps:

1. Go to tool execution records and filter by "Inventory Query Tool" + "Failure"
2. Discover 50 failed records in the past 2 hours
3. View the error message in the failed records: "Database connection timeout"
4. Check the database service status and discover the database is under maintenance
5. Temporarily disable the tool and notify customer service to use manual queries
6. Re-enable after database recovery and monitor the success rate returning to normal

Quantified Benefits:

- * Identified root cause within 5 minutes
- * Avoided hours of troubleshooting by the technical team
- * Promptly notified customer service to use backup methods, reducing customer wait times

Case 2: Optimizing Tool Performance

Scenario: The order query tool frequently runs slowly, affecting the conversation experience.

Steps:

1. Export the order query tool's execution records from the past 30 days
2. Analyze the execution time distribution and find:
 - Average execution time: 7.5 seconds
 - 25% of queries exceed 10 seconds
 - Maximum: 18 seconds
3. Review the input parameters of slow queries and find most are querying "all orders from the past year"
4. Optimize the tool configuration:
 - Limit query scope to the past 3 months

- Add pagination with a maximum of 20 records per request
5. After optimization, average execution time drops to 3.2 seconds

Quantified Benefits:

- * Execution time reduced by 57% (7.5 seconds → 3.2 seconds)
- * Queries exceeding 10 seconds dropped from 25% to 5%
- * Significantly improved conversation experience and customer satisfaction

Case 3: Discovering Unused Tools

Scenario: An enterprise configured 12 tools for the AI assistant and wants to understand actual usage to simplify the configuration.

Steps:

1. Export all tool execution records from the past 90 days
2. Count each tool's invocation count:
 - Order query: 1,500 times
 - Member query: 800 times
 - Promotion query: 300 times
 - Product specification query: 200 times
 - Other 8 tools: 0 times
3. Review the configuration of unused tools and find:
 - Some tools have unclear definitions, so the AI doesn't know when to use them
 - Some tools have overlapping functionality
 - Some tools are outdated
4. Remove 6 unused tools and optimize the descriptions of 2 low-usage tools

Quantified Benefits:

- * Simplified configuration, improving AI tool selection accuracy by 20%
- * System response speed improved by 10% (reduced tool selection judgment time)
- * Lower maintenance costs

Case 4: Monitoring API Usage

Scenario: An enterprise uses a third-party weather API with a monthly invocation limit and needs to monitor usage to avoid exceeding the quota.

Steps:

1. Export the weather query tool's execution records every Monday
2. Track the invocation count trend:
 - Week 1: 320 times
 - Week 2: 450 times
 - Week 3: 680 times
 - Week 4: Estimated 900 times (monthly limit: 2,000 times)

3. Discover rapidly growing invocation volume and analyze the cause:
 - Increased frequency of customer weather inquiries
 - Some unnecessary duplicate queries
4. Take action:
 - Add a caching mechanism to avoid duplicate queries for the same city within 1 hour
 - Optimize the prompt to prevent the AI from over-relying on the weather tool
5. After optimization, weekly invocations drop to 400, ensuring the quota is not exceeded

Quantified Benefits:

- * Avoid exceeding the API quota, which would cause service disruption
- * 40% reduction in API invocation costs
- * Maintain service quality while controlling costs

Frequently Asked Questions

Q: How long are tool execution records retained?

A: The system retains tool execution records for 3 months by default. It is recommended to regularly export important data for long-term storage and analysis. For longer retention periods, contact customer service to upgrade your plan.

Q: Why did a tool fail but the conversation seems normal?

A: When a tool execution fails, the AI assistant may:

1. Tell the user "Unable to query at this time, please try again later"
2. Use knowledge base information to answer instead (if related content exists)
3. Ask the user for more information and retry

Although the conversation continues, functionality is limited. It is recommended to track failure causes through execution records and fix them to ensure stable tool operation.

Q: How can I reduce the tool execution failure rate?

Recommended optimization approaches:

Configuration level:

- * Ensure API keys, database connections, and other configurations are correct
- * Set reasonable timeout periods (recommended 10-15 seconds)
- * Add error retry mechanisms

Prompt level:

- * Clearly describe when to use tools and the parameter format
- * Add examples to help the AI invoke tools correctly

Monitoring level:

- * Regularly check execution records
- * Promptly identify and fix issues
- * Track success rate trends

Q: What if input parameters in execution records contain sensitive data?

A: The system automatically masks sensitive fields in request headers: common credential headers (such as `Authorization` and `X-API-Key`) and all headers supplied by contact credentials are shown as `***`. Input parameters and the request body are not automatically masked. If your tools handle other sensitive data (such as customer personal information), it is recommended to:

1. Avoid having the AI pass secrets or personal data directly in tool input parameters; supply sensitive values via request headers or contact credentials instead
2. Control who can view execution records, granting access only to authorized personnel
3. In private deployments, extend the masked header list via the `TOOL_API_SENSITIVE_HEADERS` environment variable (e.g., `x-functions-key`)

Q: Can I re-execute a failed tool invocation?

A: The system does not currently support directly re-executing historical records. To test a tool, it is recommended to:

1. Ask a question in the chat platform to trigger a tool invocation
2. Use the tool testing feature (if available)
3. Fix the issue and wait for actual users to trigger it

Q: How can I see which tools were invoked in a specific conversation?

A: There are two ways:

1. **From conversation records:** The conversation details show all tools invoked during that conversation
2. **From tool records:** Click the "Associated Conversation" link in the tool execution records

Best Practices

Regular Check Recommendations

Daily check: Review failed records from the past 24 hours to ensure critical tools are operating normally

Weekly review: Count each tool's invocation count and success rate to identify items needing optimization

Monthly analysis: Export a complete report to analyze long-term trends and usage patterns

Alert Configuration Recommendations

Recommended alert settings (if supported by the system):

A tool fails more than 10 times within 1 hour

A tool's success rate drops below 80%

A tool's average execution time exceeds 10 seconds

A tool has not been used for more than 7 days (check if it's still needed)

Documentation Recommendations

Create usage documentation for each tool, recording:

Tool purpose and applicable scenarios

Input parameter descriptions and examples

Expected output format

Common errors and solutions

Optimization history

Add Conversations to FAQ

What problem does this feature solve?

When reviewing an AI assistant's conversation records, one of the most common findings is: “Customers keep asking this question, but the AI does not answer it well.” Previously, fixing this required copying the question and answer, switching to the knowledge base page, and manually creating an FAQ. Switching back and forth could easily interrupt your monitoring workflow.

Now, you can click **Add to FAQ** directly from a conversation record in AI Assistant Monitoring to organize the question and answer as an FAQ and save it to a specified knowledge base for the AI assistant to reference in future responses. You do not need to leave the monitoring page or copy and paste anything separately.

This is a key step in the AgentOps quality management cycle for “feeding issues found in production back into the knowledge base” : **Identify an issue through monitoring → turn it into an FAQ on the spot → continuously improve knowledge content.**

Which conversations should be added to FAQ?

Not every conversation needs to become an FAQ. Prioritize conversations that show both of the following signals:

Signal	What to look for in conversation records	Why it matters
Poor AI response	A low quality score or a user dislike	This indicates that the existing knowledge base cannot answer the question and a standard answer must be provided manually
Frequently asked question	Similar questions appear repeatedly while browsing conversation records	Fixing a frequently asked question once benefits all similar questions in the future

Typical scenarios include:

- Questions with fixed answers where mistakes are unacceptable:** return and exchange policies, fee calculations, and eligibility requirements. FAQs are suitable for locking in standard answers and preventing the AI from improvising.
- New questions not covered by the knowledge base:** customers begin asking about a newly launched product or campaign before the corresponding content has been added to the knowledge base.

Answers that are correct but too verbose or inconsistent with company guidelines: use an FAQ to provide a concise, compliant official version.

One-off, case-specific questions, such as the status of a particular customer's order, are **not suitable** for FAQ. The answer applies only to that customer, and saving it to the knowledge base could mislead others.

Entry point

From the left menu, click **AgentOps** → **AI Assistant Monitoring**.

Scroll down the left menu to find the AgentOps section

There are two places where you can launch Add to FAQ:

Entry point 1: Conversation records list

Switch to the **Conversation Records** tab. Each row has an **Add to FAQ** icon in the Actions column. When you spot a poorly answered conversation while browsing the list, click the icon in that row.

You need edit permission for at least one knowledge base to use this feature. See [What happens if I do not have permission?](#) below.

Create FAQ window

Clicking Add to FAQ opens the **Create FAQ** window, which contains four sections from top to bottom:

建立 FAQ

* 知識庫

docs-line 檔案格式驗證 (虛構)

這個 FAQ 會存儲固定的知識庫，並立即開始建立索引。

* 問題

單一檔案有大小上限嗎？我們有幾份手冊超過 100 MB

已幫入客戶原本的描述 (原文)。可改寫得更通用，讓相似問題也命中。存入前請自行檢視並移給訂單編號、姓名、電話等個人資料——這類問答會填入知識庫的相關範圍。

* 答案

取消

確認

Create FAQ window: the question is filled in automatically and the answer is blank by default

Section	Default value	Description
Knowledge Base	The first editable knowledge base is preselected	Required. The drop-down menu only lists knowledge bases you have permission to edit
Question	The customer's original question is filled in automatically	You can rewrite it to make it more general
Answer	Blank	Write the correct answer; click “Insert AI Response” to import the original response and edit it
Source Conversation	Collapsed	Expand it to view the complete conversation

Before saving, review and remove personal information such as order numbers, names, and phone numbers. This question and answer will become searchable knowledge base content and may be cited when the AI assistant responds to other users.

Steps

Select the target knowledge base

Select the knowledge base where you want to save the FAQ from the **Knowledge Base** drop-down menu. The system preselects the first editable knowledge base. If your AI assistant uses multiple knowledge bases, make sure you select **the one this AI assistant actually uses**. An FAQ saved to the wrong knowledge base will not be cited by this assistant.

Rewrite the question to make it more general

The **Question** field is automatically filled with the customer's original wording. Customers may use casual language, omit the subject, or include personal context. Rewrite the question as a general, standard question:

Industry	Customer's original wording (filled in automatically)	Suggested rewrite
Finance	My card won't go through	What should I do if a credit card transaction fails?

Industry	Customer's original wording (filled in automatically)	Suggested rewrite
Technology manufacturing	The machine screen shows E03. Is it broken?	How do I troubleshoot error code E03 on the equipment?
Healthcare	Can I still get an appointment tomorrow afternoon?	How do I check clinic hours and make an appointment?
Hospitality	Is there an extra charge if my child stays with me?	What are the extra-bed options and charges for children?

Rewriting principles: **remove personal context** (“my,” “tomorrow”), **add a complete subject** (“credit card,” “equipment”), and **end with a question**.

Write the answer

The **Answer** field is **blank by default**. This is intentional: you typically use this feature because the AI's original response was poor, so the system does not automatically insert it. Instead, write the correct answer yourself.

The editor works the same way as creating an entry in the knowledge base's **Q&A** section. It supports text formatting such as bold and image insertion, allowing you to clearly highlight key points.

If the AI response is only partially incorrect and its overall structure is reusable, click **Insert AI Response** in the upper-right corner of the answer field to import and edit the original response. The system then displays the conversation's quality score and user feedback (like/dislike) as a reminder:

If you need to confirm the customer's complete context while writing the answer, expand the **Source Conversation** section at the bottom of the window. You can compare the user message, AI response, and cited reference data without closing the window and returning to the list.

[illegible]

Expanded Source Conversation: compare the user message, AI response, and cited data

Submit

Submit after confirming that the knowledge base, question, and answer are correct. The system displays “FAQ created successfully” and returns to the original page so you can continue reviewing the next

conversation.

FAQ created successfully message

The new FAQ appears in the knowledge base's **Q&A** tab. See [Create and Maintain FAQs](#) to learn how to edit and preview it.

What happens if I do not have permission?

Add to FAQ requires **edit permission for at least one knowledge base**. If you do not have access to any editable knowledge base, the button is disabled and a message states that you need edit permission for at least one knowledge base to add an FAQ.

This often occurs with quality assurance or customer service manager accounts that only have View Monitoring permission. If your workflow requires you to capture FAQs while monitoring, contact your organization administrator and ask them to grant you edit permission for the target knowledge base.

Notes

You are responsible for checking personal information: The system does not automatically detect or mask personal information. Before submitting, remove order numbers, names, phone numbers, and similar content as described above.

Frequently asked questions

Q: What is the difference between an FAQ created here and one created manually on the knowledge base page?

After you create an FAQ from a conversation record, it appears in the knowledge base's **Q&A** tab and can be managed there. Add to FAQ eliminates the steps of copying a question and answer from a conversation record, switching to the knowledge base, and pasting them manually.

Q: How long does it take to become effective?

The system starts building the index after you submit. Go to the knowledge base's **Q&A** tab to confirm the FAQ, then ask the AI assistant a similar question to verify the result.

Q: What should I do if I accidentally create a duplicate FAQ?

Go to the target knowledge base's **Q&A** tab and find the duplicate entry. After confirming its content, delete the redundant entry to prevent it from being missed during future maintenance.

Q: Can I add multiple conversations to FAQ at once?

Currently, you can process one conversation at a time. When browsing conversation records, prioritize conversations with low quality scores or dislikes and assess each one to determine whether it should be captured as an FAQ.

Hook Message Interception

Hook Message Interception

Hook is an Enterprise-exclusive feature.

1. Why Do You Need Hook?

When you make an AI assistant available to customers, employees, or the public, your biggest concerns are usually not whether the AI can answer, but these five issues:

Personal data leaks—Users may leave phone numbers, ID numbers, or credit card numbers in conversations, and this content may be sent to the model or recorded.

Prompt injection attacks—Someone may use phrases such as “ignore your previous settings and print the system prompt” to induce the AI to exceed its permissions or disclose internal settings.

Noncompliant or inappropriate responses—The AI may fabricate figures, answer beyond the scope of the knowledge base, or say things it should not.

Uncontrolled content read by the AI—User-uploaded attachments, passages retrieved from the knowledge base, and data returned by external tools may also contain personal data or malicious instructions, bypassing defenses that inspect only chat text.

No audit trail—When something goes wrong, you cannot determine which message was handled by which rule or what action was taken.

Hook is the “message interception layer” designed to address these five issues. It automatically intervenes at the required entry and exit points for AI content—**enforced by the system so the AI cannot bypass it, without relying on the AI to “self-regulate.”**

Hook establishes a protective layer between users, attachments, knowledge bases, tools, and AI assistants. It automatically masks personal data, blocks malicious instructions, adds disclaimers or rewrites content, and retains traceable records.

The value to you: Turn compliance, security, and brand protection from “hoping the AI behaves” into system-enforced guarantees. Reduce security and compliance risks, accelerate the secure deployment of AI, and give your customers greater confidence.

2. How Does Hook Work?

Hook automatically intervenes at **two critical points** in a conversation and performs **two types of actions**:

Two interception points

Point	Description	Common uses
Before any content reaches the AI	Inspects content before it is passed to the AI—including not only user-entered text, but also attachments, knowledge base passages, and tool responses	Mask personal data, block malicious instructions, filter invalid messages, and intercept inappropriate content
Before an AI response is	Inspects the response generated by the AI before it is shown to the user	Mask personal data in responses and verify response reliability

Point	Description	Common uses
sent		

Two types of actions

Action	Effect	What the user sees
Modify	Masks sensitive content or rewrites a response into a more appropriate version	A processed version of the content (such as 0912-**-*)
Block	Blocks the message so it neither enters the AI nor gets sent	A custom message you define

Hook automatically intervenes before any content reaches the AI and before AI responses are sent, masking, rewriting, or blocking content. It is enforced at the system level and does not rely on AI self-regulation.

Four Sources Before Content Reaches the AI

Checks performed “before content reaches the AI” do not apply only to text entered by users. Once an AI assistant has a Hook attached at “When receiving a user message,” all four content sources below pass through the same set of Hooks before being sent to the model, **with no additional configuration required**:

Source	When it occurs	What happens when blocked
User message	A user sends text in a conversation	The user sees your custom block message, and the AI does not receive the message
Attachment	A user uploads a file whose contents will be provided to the AI for reference	That section is not sent to the model; the conversation continues, and the assistant responds based on the remaining content
Knowledge base passage	The AI retrieves a passage from the knowledge base to reference	That passage is not sent to the model; the conversation continues, and the assistant responds based on the remaining content
Tool response	In Agent mode, the AI calls a tool (such as a database, MCP connector, browser, code execution tool, or skill) and retrieves a result	The tool result is not provided to the model, and the conversation continues

Only the affected section is blocked; the conversation does not stop. For example, when a knowledge base passage containing personal data is processed by “Personal Data Masking,” the AI receives the masked version. When it is blocked by “Sensitive Keyword Blocking,” only that passage is withheld from the model, and the assistant still responds based on the conversation history and remaining content. Every check is recorded in [Hook Execution Logs](#), allowing you to trace which tool or document the content came from.

Multiple Hooks can be chained together. An AI assistant can have multiple Hooks attached simultaneously to perform filtering → masking → blocking → verification in sequence, creating a tailored protection workflow.

3. Seven Standard Templates (Ready to Use)

You do not need to write your own rules. MaiAgent provides seven standard templates. Simply select a template, adjust its parameters, and attach it to an AI assistant to get started:

Standard templates protect the entire flow from input to response. Invalid message filtering, personal data masking, prompt injection protection, and content safety classification verify content before it reaches the AI, while response reliability checks verify responses before they are sent.

Template	Interception point	Action	What it solves
Personal Data Masking	Before content reaches the AI	Modify	Automatically masks phone numbers, email addresses, ID numbers, and credit card numbers as <code>[REDACTED_*]</code> , preventing personal data from entering the model or being recorded
Semantic Personal Data Masking	Before content reaches the AI	Modify	Uses a dedicated personal data detection model to identify personal data without a fixed format, such as names and addresses, and masks it as <code>[NAME]</code> or <code>[ADDRESS]</code> , covering gaps that pattern matching cannot detect
Prompt Injection Protection	Before content reaches the AI	Block	Uses AI to identify and block attacks such as instructions to ignore commands, extract the system prompt, or role-play as an unrestricted persona
Content Safety Classification Blocking	Before content reaches the AI	Block	Uses a dedicated content safety model to classify violence, hate, sexual content, self-harm, harassment, illegal activity, and other categories; blocks matches based on a configurable score threshold
Sensitive Keyword Blocking	Before content reaches the AI	Block	Blocks messages containing specified prohibited terms, such as profanity, threats, or company-restricted language

Template	Interception point	Action	What it solves
Invalid Message Filtering	Before content reaches the AI	Block	First blocks pure greetings and spam at no cost using rules, then uses AI to identify pure small talk and messages with no consultation intent, reducing Token costs
Response Reliability Check	AI response	Modify	When an AI response is uncertain or lacks evidence, rewrites it to acknowledge the uncertainty honestly and recommend contacting a specialist, reducing hallucination risk

The two personal data masking templates can be used together. “Personal Data Masking” uses pattern matching, has almost no cost and extremely low latency, and is suitable for running first.

“Semantic Personal Data Masking” uses a dedicated detection model and can identify names and addresses in free-form text, but every call adds latency and cost. We recommend attaching both: use the former to mask structured personal data first, then the latter to cover semantic personal data.

How different industries can use Hook (examples)

Industry	Typical combination
Finance banking securities	Personal Data Masking + Semantic Personal Data Masking + Prompt Injection Protection + Response Reliability Check (protect personal data, prevent manipulation, and avoid fabricated figures)
Healthcare	Personal Data Masking + Semantic Personal Data Masking + Response Reliability Check (mask patient names and addresses and avoid providing unverified medical information)
E-commerce retail	Invalid Message Filtering + Sensitive Keyword Blocking + Content Safety Classification Blocking (filter spam to reduce costs, maintain conversation quality, and block harassment and hate content)
Educational institutions	Prompt Injection Protection + Content Safety Classification Blocking (prevent privilege escalation and self-harm or bullying content when services are open to students)
Government public sector	Personal Data Masking + Prompt Injection Protection (protect citizens’ data and secure public-facing services)

4. See the Results in Action

The following examples show how the standard templates work in actual conversations. After completing the setup, send the corresponding content in a conversation to see the message masked or blocked:

Personal Data Masking: A user sends a message containing a phone number, and the number is automatically masked before the message reaches the AI.

Prompt Injection Protection: A user attempts to induce the AI to ignore its settings and print the system prompt. The message is blocked, and a notification is returned.

Sensitive Keyword Blocking: A user message contains a specified prohibited term, so it is blocked and a custom notification is returned.

Invalid Message Filtering: Pure greetings and messages with no consultation intent are blocked, preventing Tokens from being wasted on the AI.

Response Reliability Check: Instead of letting the AI guess at an uncertain question, Hook rewrites the response to acknowledge the uncertainty honestly and recommend contacting a specialist.

5. Next Steps

Ready to set it up? See [Add and Configure a Hook](#) to learn how to create a Hook from a template, adjust its parameters, and associate it with an AI assistant.

Want to review interception records? See [Hook Execution Logs](#) to learn how to review each interception or modification, control whether original messages are logged, and view execution details from a conversation.

Prerequisite: The Hook feature must be enabled for your organization by MaiAgent. If the “Hook” menu does not appear in the admin console, contact the MaiAgent team to enable it.

Create and Configure Hooks

This page explains how to create a Hook from a standard template, configure its parameters, and attach it to an AI assistant so it can start working.

1. Add a Hook

1. Open the Hook List

From the left menu, go to **AI Features** → **Hook**. The list displays all Hooks in the current organization, including their **name**, **description**, **type**, **interception point**, **action**, **associated AI assistants**, **enabled status**, **creator**, and **update time**.

名称	类型	拦截点	ID	状态	更新时间	操作
知识库检索 (检索前拦截)	知识库检索	知识库检索前	1001	启用	2024-10-26 10:26:24	编辑 删除
知识库检索 (检索后拦截)	知识库检索	知识库检索后	1002	启用	2024-10-26 10:26:24	编辑 删除
知识库检索 (检索中拦截)	知识库检索	知识库检索中	1003	禁用	2024-10-26 10:26:24	编辑 删除
知识库检索 (检索失败拦截)	知识库检索	知识库检索失败	1004	启用	2024-10-26 10:26:24	编辑 删除
知识库检索 (检索超时拦截)	知识库检索	知识库检索超时	1005	禁用	2024-10-26 10:26:24	编辑 删除
知识库检索 (检索异常拦截)	知识库检索	知识库检索异常	1006	启用	2024-10-26 10:26:24	编辑 删除

The Hook list shows each Hook's type, interception point (when it intervenes), action (modify/block), associated AI assistants, and enabled status.

2. Select a Template

Click **Add Hook** in the upper-right corner, then select a standard template in the pop-up window. Each template card shows its **interception point** and **action**, making it easy to quickly identify its purpose.

Select a template: Each of the seven standard templates indicates its interception point (when receiving a user message/after an AI response is generated) and action (modify/block).

The creation process has three tabs: Template (which type to use) → Basic Information (name and description) → Apply to AI Assistants (which assistants to attach it to). After selecting a template, complete each tab in order.

2. Configure Parameters

Each template has different parameters. You can configure them on the Hook settings page after creation. Common parameters include:

Template	Main parameters	Description
Personal Data Masking	PII types to mask	Select the types to detect (Email/mobile phone number/ID number/credit card)
Semantic Personal Data Masking	Personal data detection model and detection types, minimum confidence, masking style	Select a detection service, then choose the personal data types to mask (name, address, phone number, and more); increasing the confidence value can reduce false positives

Template	Main parameters	Description
Sensitive Keyword Blocking	Prohibited terms, minimum term length	Enter one prohibited term per line; the minimum term length filters out terms that are too short and helps prevent false positives
Prompt Injection Protection	Evaluation model, additional evaluation rules	Select an LLM to determine whether content is an attack; you can also add custom rules
Content Safety Classification Blocking	Content safety model and blocked categories, additional score threshold, behavior when the detection service is unavailable	Select a detection service, then choose the categories to block; if none are selected, any category violation will be blocked
Invalid Message Filtering	Greeting list, consecutive repetition limit, evaluation model	Rules filter messages first, then an LLM determines whether a message is invalid
Response Reliability Check	Rewrite model, verification criteria	Select an LLM to determine whether a response is reliable and rewrite it

Using Personal Data Masking as an example, you can select the PII types to detect and set the enabled status.

Evaluation Model (LLM-Based Templates)

Templates that require semantic evaluation—Prompt Injection Protection, Invalid Message Filtering, and Response Reliability Check—include an **evaluation model** field. The drop-down menu lists the models currently available to your organization. This evaluation runs for every message, so **we recommend**

selecting a fast, lower-cost model (such as Haiku, GPT-5 mini, or Gemini Flash). Leave the field blank to use the platform's default model.

Using Response Reliability Check as an example, you can select the evaluation model from the LLMs available to your organization and describe the evaluation approach in plain language under Verification Criteria.

Detection Service (Safety Model-Based Templates)

Content Safety Classification Blocking and Semantic Personal Data Masking do not use a general-purpose LLM for evaluation. Instead, they send content to a **dedicated safety model**. This model returns structured classifications and scores that support thresholds and auditing, with lower latency and cost than an LLM judge. Both templates use a **two-step** configuration: first select a detection service, then choose the items to process.

Content Safety Classification Blocking

Under **Content Safety Model and Blocked Categories**, select a detection service from the first drop-down menu (OpenAI Moderation is currently available).

In the second drop-down menu, select the categories to block, such as harassment, hate, illegal activity, self-harm, sexual content, and violence. **Selecting no categories means that any category violation will be blocked** (the strictest option and the recommended starting setting).

The default **Additional Score Threshold** is 0, meaning the model's determination is used directly. If you set a value between 0 and 1, a score must also meet that threshold to be blocked. Raising the threshold can reduce false positives.

When the Detection Service Is Unavailable determines what happens when the service times out or no key is configured: **pass** allows the message through (availability first; default), while **block** always

blocks it (compliance first; recommended for regulated industries).

Content Safety Classification Blocking: First select a detection service, then choose the categories to block. Below, you can set an additional score threshold and the behavior to use when the service is unavailable.

The detection service provides the selectable categories in real time. Each category displays the service's native category name, and the list changes when you switch services.

Semantic Personal Data Masking

Under **Personal Data Detection Model and Detection Types**, select a detection service from the first drop-down menu (Google Cloud DLP is currently available).

In the second drop-down menu, select the personal data types to mask. “Standard types” include names, addresses, phone numbers, email addresses, Taiwan ID numbers, and Taiwan passport numbers, while “provider-specific types” include credit card numbers, IBANs, and other detailed types.

Selecting more types increases the cost of each call, so we recommend selecting only those that your business actually needs to mask.

The default **Minimum Confidence** is 0.5. Detection results below this value are ignored. Raising the value can reduce false positives (such as mistaking a company name for a person's name), at the cost of potentially missing some data.

Masking Style: **type_token** replaces content with placeholders such as **[NAME]** and **[ADDRESS]**, so the AI still knows what type of data was originally present (recommended); **asterisk** replaces it with an equal number of asterisks, completely concealing the type.

The selectable personal data types are divided into “standard types” and “provider-specific types,” presented in separate sections within the same menu.

Content will be sent to an external detection service. These two templates send the text to be checked to a detection service (OpenAI or Google Cloud) for evaluation. Organizations with data residency requirements or policies that prohibit external data transfers should confirm compliance before enabling them. When you switch detection services, selected items are automatically cleared to prevent incompatible types from causing a save failure.

Block messages are customizable. Blocking templates (such as Prompt Injection Protection, Sensitive Keyword Blocking, Invalid Message Filtering, and Content Safety Classification Blocking) let you configure the message returned to users when content is blocked under **Block Response Message**. For example: “Your message contains inappropriate language. Please revise it and try again.”

3. Associate AI Assistants

A Hook only takes effect after it is **attached to an AI assistant**. There are two ways to do this:

Attach during creation: On the Apply to AI Assistants tab when creating a Hook, select the assistants to which it should apply.

Attach from assistant settings: Open an AI assistant's settings page, switch to the **Hook** tab, and select the Hook to apply.

On the Hook's Apply to AI Assistants tab, move the Hook from the “Available” list on the left to the “Selected” list on the right to complete the association.

An assistant can have multiple Hooks attached. The system executes them in sequence. For example, it can first use Invalid Message Filtering to block spam, then use Personal Data Masking to mask personal data, and finally use Prompt Injection Protection to block attacks—creating a tailored protection workflow.

When a “When receiving a user message” Hook is attached, attachments, knowledge base passages, and tool responses are also checked. No additional configuration is required. If an assistant has a Hook that runs before content reaches the AI, content from user-uploaded attachments, passages retrieved from the knowledge base, and results returned by tools in Agent mode all pass through the same set of Hooks before being sent to the model. See [Hook Message Interception](#) for details.

Enable the Hook

After confirming the parameters and associated assistants, set the Hook to **Enabled**. Once enabled, the Hook runs automatically at the corresponding point whenever a user interacts with that assistant.

4. Next Steps

After completing the setup, you can view each interception or modification in [Hook Execution Logs](#) to confirm that the Hook is working correctly.

Hook Execution Logs

Every interception, modification, or pass performed by Hook is recorded. For regulated industries such as finance, healthcare, and government, **traceability is itself a compliance requirement**—when a problem occurs, you must be able to determine which message was processed by which rule, what action was taken, and when it happened.

The Audit Log records every action in full, including the matched rule, action taken, processing result, and timestamp. It supports keyword searches, filtering by assistant, and report exports.

1. View Execution Logs

From the left menu, go to **AgentOps** → **Hook Execution Logs**. For each execution, you can see:

AI assistant—The AI assistant that triggered it

Hook name and Hook type—The Hook that processed it

Trigger point—When the Hook intervened (when receiving a user message after an AI response was generated)

Hook action and result—What it did (mask and modify intercept and block pass) and the processing result

Message content and creation time—Which message was processed and when it occurred

You can filter by **assistant**, **rule**, **type**, **action**, **action result**, **trigger point**, **date range**, or **keyword**, and you can also **export reports** for further audit analysis. The top of the page also displays statistics for the **total number of executions**, **number of matches**, and **match rate**.

AI

Execution log list: Each entry shows the AI assistant, Hook name, trigger point, action, and result. You can see actual actions such as Personal Data Masking replacing a phone number with [REDACTED_PHONE], or sensitive keywords and prompt injections being blocked.

View Details for an Individual Entry

Open any entry to view the full context of the action: **basic information (Hook name, type, trigger point, action, and result)**, **related information**, **message content**, and **Metadata**. This lets you clearly understand what the system did.

Entry details: In this Personal Data Masking example, the action is modify and the message content has been masked as [REDACTED_PHONE].

Trace Checks on Attachments, Knowledge Bases, and Tool Responses

Hooks that run before content reaches the AI inspect more than user-entered text. Attachment content, passages retrieved from the knowledge base, and tool responses in Agent mode all pass through the same set of Hooks (see [Four Sources](#)). These checks also create execution log entries, with the trigger point shown as “When receiving a user message.” Open an entry and look in the **Metadata** section to see:

path: `input_context`, indicating that this entry is for content that was not directly entered by the user

source: Where the content came from—a tool response shows the tool name, while a passage from the knowledge base is shown as retrieved content

When you need to determine which tool or document supplied sensitive content to the model, use **source** to trace it back. Blocked content is not provided to the model, and the conversation itself does not stop.

2. Control Whether Original Messages Are Logged

By default, execution logs **record only the processing result and do not retain the original sensitive content**. This prevents personal data or sensitive messages from being stored again in the logs.

If you need to see the original content during debugging, go to the Hook settings page and change the **Log original value before masking** toggle from **off** to **on** . Once enabled, the logs also retain the original content before masking or blocking, making investigation easier.

Use the “Log original value before masking” field on the Hook settings page to control this behavior. The default is off (only the type and count are recorded; original personal data is not retained). Change it to on only when debugging is required.

Privacy trade-off: Enabling “Log original value” stores the original personal data or message content in the execution logs. For security reasons, we recommend keeping it disabled during normal operation and enabling it temporarily only when troubleshooting.

Execution logs for “Semantic Personal Data Masking” inherently contain no original text: the detection service returns only the location and type of personal data, so the logs retain only the types and counts that were masked.

3. View Hook Execution Details from a Conversation

In addition to the centralized execution logs, you can also **trace actions from an actual conversation**. Go to **Customer Service Conversations** → **All Conversations** and open any conversation. You can then see which messages in that conversation were processed by Hook (masked or blocked) and the corresponding action taken at the time.

This allows you to understand directly why a message was masked or blocked while reviewing a customer conversation, without having to cross-reference a separate log.

Meeting Records

Meeting Records Feature Overview

Meeting Records is the voice transcription and AI summary feature of the MaiAgent platform, offering both **live** and **offline** modes. Live mode provides low-latency transcription and translation during meetings; offline mode lets you upload audio recordings for high-accuracy transcription and speaker identification. Both modes support AI auto-summary, Q&A, download/export, and knowledge base integration.

Meeting Records List

Two Modes

	Live Meeting Records	Offline Meeting Records
Input Method	Real-time microphone recording	Upload audio files (mp3, mp4, m4a, aac, wav)
Transcription Features	Low-latency real-time transcription	Multi-language high-accuracy transcription
Translation	Low-latency real-time translation (up to 3 languages)	Post-transcription translation
Speaker Identification	Depends on STT engine support	High-accuracy speaker identification and

	Live Meeting Records	Offline Meeting Records
		management
Timeline	Real-time marking	High-accuracy timeline recognition
Subtitle Playback	—	Dynamic subtitle playback, synced with audio
Backup Audio	Synchronized local backup recording in the browser prevents audio loss during network outages (see Meeting Record Backup Audio)	—

Common Features

Feature	Description
Multi-language Transcription	Supports speech recognition in multiple languages
Multi-language Translation	Translates transcribed content into multiple target languages
Auto Summary	Automatically generates meeting highlights using a custom AI assistant
AI Q&A, Agent Ticket Creation	Ask questions about the transcript; if the selected AI assistant is configured with ticket creation tools, you can ask it to turn meeting action items directly into tasks or tickets
Download & Export	Download MP3 recordings, plain text transcripts, and SRT subtitle files
Knowledge Base Integration	Upload transcripts to the knowledge base for Agent reference

Workflow

Live Mode:

Create Meeting → Configure STT Engine & Translation → Start Recording → Low-latency Real-time Transcription

↓
Meeting Ends → Review Transcript
↓

Meeting Record Statuses

Status	Description
Pending (Pending)	Created or uploaded, processing has not started
Recording (Recording)	Transcription in progress in live mode
Processing (Processing)	After recording ends or audio upload, the system is processing
Completed (Completed)	Processing complete, transcript can be viewed and summaries generated
Failed (Failed)	An error occurred during processing

Deployment Options

Meeting Records supports multiple deployment options:

SaaS: Use the MaiAgent cloud service directly

Private Cloud: Deploy in the customer's cloud environment

On-Premises: Install on the customer's local servers

Permissions

Meeting Records requires organization-level activation before use, with three permission levels:

View Permission: Browse the meeting list, view transcripts, and download files

Transcription Permission: Create meetings, start recordings, upload audio files, edit and delete meeting records

Management Permission: Determines whether a user can see all meetings in the organization, or only meetings they participate in

The meeting list **only shows meetings you created or were added to** by default. For details on who can see which meetings and how to share meetings with colleagues, see [Meeting Access Control](#).

Create a Meeting Record

Create a New Meeting

Go to the "Meeting Records" page
Click "New Meeting"
Fill in the following information:

Field	Description	Required
Meeting Name	The meeting title for easy searching and identification	Yes
Participants	Select organization members; added members automatically receive viewing access to this meeting	No
External Participants	For customers, vendors, and other non-organization members. Enter a name and press Enter. Names are recorded only in the meeting information and do not receive viewing access. See Meeting Access Control for details	No
Speech Recognition Engine (STT)	Select the speech-to-text engine	Yes
Recognition Language	Languages used in the meeting (up to 3)	Yes

Select a Speech Recognition Engine

The system provides multiple STT (Speech-to-Text) engines, each with different language support and recognition quality:

Engine	Features
Deepgram	High-quality real-time transcription, supports multiple languages
Azure	Microsoft Speech Services, excellent Chinese and English recognition
AssemblyAI	High accuracy, ideal for English scenarios
WhisperLive	Based on OpenAI Whisper, supports a wide range of languages
Bronci	Customized engine

Different engines support different languages and quantities. After selecting an engine, the system automatically displays the available language list.

Speech Recognition Provider Selection

Configure Real-time Translation (Optional)

If participants speak different languages, enable real-time translation:

Turn on the "Enable Translation" toggle

Select target translation languages (up to 3)

Select the LLM model for translation

Translation occurs simultaneously with transcription, and the transcript displays both the original text and translation results.

Language Selection and Translation Settings

Link Knowledge Base (Optional)

You can specify a knowledge base to link when creating the meeting. After the meeting ends, you can upload the transcript to the knowledge base with one click, allowing the Agent to access meeting content.

Manage Meeting Records

On the meeting records list page, you can:

Search: Search by meeting name

Filter: Filter by status (Pending, Recording, Processing, Completed, Failed)

Date Range: View records within a specific time range

Edit: Modify meeting name, language settings, translation settings, and knowledge base links

Delete: Remove unwanted meeting records

Live Meeting Transcription

Live mode provides low-latency voice transcription and translation, allowing you to see the real-time transcript while the meeting is in progress.

Start Recording

After creating a meeting record, click "Start Recording" to begin live transcription.

Live Transcription Setup Page

The system will:

- Create a real-time communication room (LiveKit)
- Start the speech recognition engine
- Begin receiving microphone audio and transcribing in real time

Transcription View

During recording, the screen displays in real time:

Recording Timer: Shows the elapsed recording time

- Live Transcript:** Speech recognition results appear on screen in real time
- Speaker Labels:** Indicate the speaker for each text segment
- Language Tags:** Display the original language of each text segment
- Translation Results:** If translation is enabled, translated text appears below the original text
- Transcription Statistics:** Number of completed segments, in-progress segments, and total word count
- Local Backup Status:** "Recording Local Backup" appears below the meeting name, indicating that the browser is simultaneously recording a backup audio file so no audio is lost if the network disconnects. See [Meeting Record Backup Audio](#) for details

Low-latency Real-time Transcription

The core feature of live mode is low latency — transcribed text appears on screen within seconds of speaking, allowing participants to verify the record in real time.

Low-latency Real-time Translation

- When translation is enabled, the system translates content into the specified target languages simultaneously with transcription, also with low latency:
- Supports up to **3 target languages** for simultaneous translation
- Translation is processed in real time by the selected LLM model
- Translation results are attached below each transcript segment
- Ideal for international meetings and multilingual team communication

Controls

Control	Description
Microphone Toggle	Temporarily mute or unmute the microphone
Stop Recording	End the meeting recording; the system begins post-processing
Search Transcript	Search for keywords in the live transcript
Add Remove External Participants	Record or remove customers, vendors, and other non-organization members who join unexpectedly at any time in the "External Participants" section of the Participants card on the right, without interrupting the recording. See Meeting Access Control for details

After Recording Ends

After clicking "Stop Recording," the meeting status changes to "Processing" and the system performs the following in the background:

Audio Conversion: Convert the raw audio to MP3 format

Transcript Organization: Organize live transcription results into a structured transcript file

Cloud Storage: Upload the audio and transcript to S3 storage

Once processing is complete, the status automatically updates to "Completed," and you can access the meeting detail page to view the full content. The local backup audio uploads and merges in the background. When complete, the details page displays "Backup Complete." See [Meeting Record Backup Audio](#) for details.

Meeting Records Quick Access

In the **Office Apps** section on the MaiGPT home page, select **Meeting Records** to start recording immediately or continue viewing an existing meeting under **Recent Records**.

The Meeting Records quick access panel lets you start recording, connect your calendar, and view recent records

Use Case

After a regular project meeting, a project manager wants to check in MaiGPT whether a summary has been generated. She opens **Meeting Records**, selects the meeting under **Recent Records**, and checks the summary status in the panel. When finished, she selects **Back to Entry** to return to the start recording screen. If she needs the transcript or other complete details, she can select the button on the right side of the record to open the full record page. This leaves the MaiGPT chat page; after reviewing the record, she can return to MaiGPT from the sidebar.

View Recent Records

1. Open the Quick Access Panel

On the MaiGPT home page, select **Meeting Records**.

2. Select a Meeting

Under **Recent Records**, select a meeting to view its summary or summary status directly in the panel.

3. Return to the Entry Screen

On the summary screen, select **Back to Entry** to return to the calendar and start recording screen.

After selecting a recent record, you can view its summary status and return to the entry screen

4. Open the Full Record

When you need the transcript or other complete details, hover over the button on the right side of the record. When the **View Full Record** tooltip appears, select the button to open the full record page for that meeting. This leaves the MaiGPT chat page; after reviewing the record, select MaiGPT from the sidebar to return.

Recent Record Statuses

Screen Status	Meaning	Recommended Action
Generating	The meeting is still being transcribed, processed, or summarized	Reopen the quick access panel later to check the latest status
Generation Failed	Meeting transcription or summary generation failed	Open the full meeting record to review the failure status

Screen Status	Meaning	Recommended Action
No Summary Yet	The meeting is complete, but no summary is available to display	Open the full meeting record to generate or view the summary

If Recent Records displays No Meeting Records Yet, complete a meeting recording first, then return to this panel to view it.

For complete instructions on recording, transcription, and summaries, see [Create a Meeting Record](#), [Live Meeting Transcription](#), and [AI Meeting Summary & Q&A](#).

Meeting Record Backup Audio

Live meeting records send microphone audio over the network for cloud transcription. Previously, if a laptop lost its connection during a meeting, audio from the disconnected period could not be sent, leaving a gap in both the cloud recording and transcript. **Backup audio** fills this gap: when recording starts, the browser also records a local backup and uploads it in segments. Even if the network disconnects, local recording continues, and the segments upload automatically when the connection is restored. After the meeting, the system combines all segments into a complete backup audio file—the most complete recording in the system.

Backup audio is created only for live meeting records (recorded with a microphone). Meetings created by uploading an offline audio file already have a complete file and do not generate backup audio.

Use Case

A customer service manager uses a laptop in a conference room to record a product meeting with Live Transcription. Halfway through, the Wi-Fi becomes unstable. The transcript stops updating, but "Recording Local Backup" remains visible below the title, so she knows no audio is being lost and continues as usual. After clicking "Stop Recording," she sees "Backup Complete" on the meeting details page and switches the player to "Backup Audio" to confirm that the discussion during the outage is included. She then clicks "Retranscribe," changes the source to "Backup Audio," reviews the estimated cost, and confirms. A few minutes later, a backup version appears in the Transcript tab, where she can view the complete meeting without asking colleagues to reconstruct the missing section from memory.

Backup Status During Recording

After you click **Start Recording**, the backup status appears below the meeting name:

Display Text	Meaning
Recording Local Backup	Cloud recording and local backup are running simultaneously; everything is working normally
Syncing Backup, N Segments Remaining	The network is unstable or disconnected. Recorded segments are queued locally and upload automatically when the connection is restored; no action is required
Local Backup Unavailable (Reason); Meeting Continues	Backup cannot be enabled (for example, the browser is unsupported, browser storage is unavailable, or another tab is already recording). The meeting and

Display Text	Meaning
Normally	cloud recording are unaffected

The local backup status appears below the meeting name during recording

- Backup recording runs in the browser. Keep the entire meeting open in the same browser tab. Only one tab can record a meeting; a second tab displays "Recording in Another Tab."
- When you click the microphone icon to the left of "Stop Recording" to mute, the corresponding section of the backup audio is also muted, so content you do not want recorded is not captured.
- Local backup data awaiting upload is limited to 1 GB. Once the limit is reached, you cannot start another backup recording.

Backup Status After the Meeting

After you click **Stop Recording**, the meeting status first changes to "Completed." Backup audio has its own sync status, displayed next to the title on the meeting details page:

Status	Meaning
Backup Complete	The meeting is complete and the backup audio is fully synchronized—this backup is the most complete recording in the system
Syncing Backup	The meeting is complete, but the local backup audio is still uploading and merging. The status automatically changes to "Backup Complete" when finished
Backup Incomplete	The backup has not synchronized after more than one day. The system combines the uploaded segments into a backup audio file with the final section missing

Meeting details page: the "Backup Complete" label and audio source switch

In the meeting list, meetings whose backups are not yet finalized display an additional icon beside the status column. Hover over it to view details. Meetings with completed backups have no additional indicator.

If the original transcript is missing a section due to a network outage, you can retranscribe the backup audio to create a new transcript version. The existing transcript is retained.

Open Retranscription

Open the meeting details page and click **Retranscribe** in the upper-right corner.

Select "Backup Audio" and Confirm the Cost

Under **Transcription Source**, select **Backup Audio**. Billing information appears at the bottom of the dialog, including the billable item (audio transcription), backup audio duration, and estimated cost. It also explains that "you are charged only if transcription succeeds; failed attempts are free" and "each retranscription is billed separately."

The dialog discloses the estimated cost and billing rules

Submit the Transcription

Click **Confirm Audio Transcription (Approx. X credits)**—the button displays the estimated charge. After submission, the screen indicates that transcription has started and that you will be charged only if it succeeds. A "Processing" entry appears under "Retranscription History."

View the Backup Transcript Version

After transcription is complete, a version labeled "Backup" appears in the version menu on the Transcript tab (for example, "Azure • 09/06 00:42 • Backup"). When selected, the player **automatically switches to the backup audio**, allowing you to click the transcript and jump accurately to the corresponding timestamp.

Version menu on the Transcript tab: original transcript and backup version

- The backup transcript aligns only with the backup audio. If you manually switch to "Original Audio" while viewing the backup version, the screen warns: "The transcript and the audio being played come from different recordings. Clicking the transcript cannot jump precisely to that sentence."
- If the organization wallet has insufficient funds, "Backup Audio" is disabled and displays "Insufficient wallet balance. Please add funds first." No transcription job is created, and no charge is made.
- If the system detects that the end of the original transcript may be missing, a "The end of the transcript may be missing approximately N minutes" notice appears at the top of the Transcript tab, with a [Retranscribe Using Backup Audio](#) shortcut.

Generate a Summary from a Backup Transcript

When you click **Generate Summary** on the Meeting Summary tab, **Transcript Source** defaults to "Original Transcript." If a backup version is available, you can select it so the summary includes the recovered sections. The dialog then states: "The backup transcript timeline corresponds to the backup audio and differs from the original audio."

Select a transcript source when generating a summary

Further Reading

[Live Meeting Transcription](#): Start recording and view the recording screen

[Meeting Record Details](#): Transcript, player, and meeting information

[AI Meeting Summary & Q&A](#): Generate summaries and manage summary versions

Offline Meeting Transcription

Offline mode lets you upload pre-recorded audio files. The system performs high-accuracy transcription and speaker identification, generating a transcript with timeline markers.

Supported Audio Formats

Format	Extension
MP3	<code>.mp3</code>
MP4	<code>.mp4</code>
M4A	<code>.m4a</code>
AAC	<code>.aac</code>
WAV	<code>.wav</code>

Upload Audio

- Go to the "Meeting Records" page
- Select upload audio
- Choose a local audio file (supports mp3, mp4, m4a, aac, wav)
- The system begins background processing
- After uploading, the meeting record status changes to "Processing" and the system automatically starts transcription.

Multi-language High-accuracy Transcription

- Offline mode uses a high-accuracy speech recognition engine (such as WhisperX), which provides higher recognition accuracy compared to live mode:
- Supports multi-language recognition
- Higher recognition accuracy than live transcription
- Ideal for important meetings that require precise records

Speaker Identification and Management

Offline mode supports automatic Speaker Diarization, where the system automatically distinguishes between different speakers:

Auto Identification: The system automatically labels different speakers (e.g., SPEAKER_00, SPEAKER_01)

Custom Names: Replace system labels with real names (e.g., "Manager Zhang", "Team Lead Li")

Management Interface: Manage all speaker label names in one place

After modifying speaker labels, all related segments in the transcript are updated simultaneously.

High-accuracy Timeline Recognition

Each transcribed text segment includes precise start and end times, allowing you to:

Pinpoint the exact time of each utterance

Sync with the audio player for jump navigation

Export as SRT subtitle files with timestamps

Dynamic Subtitle Playback

Offline mode provides dynamic subtitle playback that syncs the audio player with the transcript:

Sync Highlighting: During audio playback, the current transcript segment is automatically highlighted

Click to Jump: Click any transcript segment to jump the audio to the corresponding time point

Search and Navigate: After searching for a keyword, jump directly to that segment's audio position

This feature lets you quickly find specific discussion content in a meeting without listening to the entire recording from the beginning.

Meeting Record Details

After meeting recording processing is complete, you can view the full meeting content on the detail page.

Page Structure

The detail page contains the following sections:

Audio Player: Play the meeting recording MP3. For live meetings with backup audio, you can switch between "Original Audio" and "Backup Audio" above the player. See [Meeting Record Backup Audio](#) for details

Meeting Info Card: Meeting name, participants, recording duration, creation time

Content Tabs: Transcript, Plain Text, Summary, AI Q&A, Download

Transcript Tab

Meeting Details — Transcript Tab

Displays the complete transcript in timeline format:

Timestamps: Start time of each text segment

Speaker Names: Indicate who is speaking

- Language Tags:** Original language labels
- Translation Content:** If translation is enabled, displays translation results
- Keyword Search:** Search for specific content in the transcript

Plain Text Tab

Meeting Details — Plain Text Tab

Presents the transcript in plain text format for easy reading and copying of the complete meeting content. Also supports keyword search.

Meeting Info Sidebar

The right sidebar displays:

- Basic Information:** Meeting date, meeting time, meeting duration, speech recognition provider
- Participants:** The access roster for this meeting (the creator is labeled as host); you can add or remove members — see [Meeting Access Control](#) for details
- External Participants:** Names of attendees who are not organization members. You can add or remove names; this is a text-only roster and does not represent access permissions. See [External Participants](#) for details

Meeting Access Control

Meeting content often involves sensitive information, so the meeting list **does not show all meetings in the organization**. By default, each member can only see meetings they are involved in; to share a meeting with colleagues, grant access through the "Participants" roster within the meeting.

Who Can See Which Meetings

Identity	Visible Scope in Meeting List
Regular Member	Only meetings they created + meetings they were added to as a participant
Organization Owner	All meetings in the organization
Member with "Meeting Record Management Permission"	All meetings in the organization

Meetings without access permission will display a "meeting not found" message even when accessed directly via URL — the system will not reveal its existence.

Meeting list: The "Participants" column shows the access roster for each meeting

The person who created the meeting automatically becomes the host and can always see the meetings they created.

Participants: The Meeting Access Roster

The "Participants" card on the right side of the meeting detail page is the **access roster** for that meeting — only people on the roster can see the meeting.

Participants card: Host label, member list, add participant button

Card contents:

Host: The meeting creator, with a host label next to their name

Members: Organization members who have been added

External Participants (bottom of card): Names of attendees who are not organization members; this is a **text-only roster and does not represent access permissions**. See [External Participants](#) for details

The "Participants" column in the meeting list also displays this roster, showing  when there are more than 2 people.

"Participants" and "External Participants" are two different things. External participants are recorded by name only and cannot access the meeting; to grant viewing access, you must add an organization member to the participants roster.

Who Can View and Who Can Edit the Roster

Action	Condition
View participants roster	Anyone who can see the meeting
Add Remove participants	Organization Owner, member with "Meeting Record Management Permission", or any participant already on the roster

Add a Participant

1. Open the meeting detail page

Click on the meeting you want to share in the meeting list.

2. Click the "+" in the upper right corner of the participants card

The card will expand a member selection dropdown.

3. Select an organization member and click "Add"

Select the person to add from organization members

The dropdown only lists members from the **same organization**, with keyword search available

Members already on the roster will not appear in the dropdown

After successfully adding, the person can **immediately** see the meeting in their meeting list

Remove a Participant

Click the "X" on the right side of the member in the participants roster and confirm to remove them. The person immediately loses viewing access to the meeting.

The host cannot be removed. The meeting creator's row does not have a remove button, ensuring the meeting always has at least one person who can manage it.

External Participants: Record Non-Organization Members

Attendees such as customers, vendors, and consultants who are **not organization members** cannot be added to the "Participants" roster, but you can record them under "**External Participants**." External participants are a **text-only roster**: their names are recorded in the meeting information to provide a complete attendee list, but they **do not receive viewing access or notifications and do not need an account**.

Use Case

A sales manager is holding a product onboarding meeting with two colleagues from her team and two customer contacts. She opens "Live Transcription" and selects the two colleagues under "Participants" so they can view the transcript after the meeting. She then enters the customer contacts' names and company under "External Participants." Halfway through the meeting, the customer's technical manager

joins unexpectedly. She clicks "+" in the "External Participants" section on the right and adds the manager's name without interrupting the recording. After the meeting, the Participants card on the meeting detail page clearly separates the two groups: colleagues appear under "Participants," while customers appear under "External Participants." The full attendee list is easy to review, while the customers still cannot access the meeting content.

Record Participants When Creating a Meeting

In the "Live Transcription" setup form, the "External Participants" field appears below "Participants." Enter a name and press Enter to turn it into a tag. You can add multiple names in succession. When recording starts, the roster is created along with the meeting.

"Participants" only lets you select organization members and grants them viewing access; "External Participants" lets you freely enter names that are recorded only in the meeting information

The "External Participants" field is currently available in the Live Transcription setup form. It is not available in the offline audio upload form or the edit dialog in the meeting list. For offline meetings or names added afterward, use the sidebar on the meeting detail page (see the next section).

Add or Remove Participants in the Sidebar During or After Recording

The Participants card on the right side of both the Live Transcription page (while recording) and the meeting detail page (after the meeting) includes an "External Participants" section. You can add or remove names at any time:

1. Add

Click "+" next to "External Participants," enter a name, and press Enter or click "Add." The roster updates immediately after it is saved and remains current after you leave, return to, or refresh the page.

2. Remove

Click the "X" next to a name to remove it. No confirmation dialog appears; if you remove someone by mistake, you can add the name again immediately.

The sidebar has two sections: "Participants" are organization members with viewing access, while "External Participants" are a text-only roster

Anyone who can add or remove external participants has the same permissions as someone who can edit the meeting: members with "Transcription Permission" who can view the meeting. Other users can only view the roster

If saving fails, the page displays "Failed to update external participants." The roster remains unchanged, and recording is not affected

Roster Rules

Rule	Description
Maximum number	Up to 20 people per meeting. Once the limit is reached, no more names can be added and a notification appears
Name length	Up to 50 characters per person. If the name is too long, a notification appears and the name is not automatically truncated
Duplicate names	Identical names are treated as the same person and merged automatically
Whitespace	Empty input or input containing only spaces is not added to the roster

These rules apply consistently to the setup form, the sidebar during recording, and the sidebar after the meeting.

Meetings started from a calendar invitation (for example, starting a recording after connecting a calendar in the MaiGPT meeting record shortcut panel) automatically import the invitee list. Invitees who are organization members become "Participants" and receive viewing access, while everyone else is recorded as an "External Participant." You can still adjust the roster afterward in the sidebar.

Grant "See All Meetings" Access

For scenarios like auditing, handover, or department managers who need an overview of all meetings in the organization, grant access through role permissions:

1. Go to the Role Permission page in Organization Settings

See [Role Permission Management](#).

2. Edit role permissions and check "Meeting Record Management Permission"

Check "Meeting Record Management Permission" to allow role members to see all meetings in the organization

"Meeting Record Management Permission" is located at the bottom of the permission list and is an independent main permission:

Unchecked: Role members can only see meetings they participate in (created or added to)

Checked: Role members can see all meetings in the organization

When checking "Meeting Record Permission", the system will **automatically check** this permission as well; if you only want the role to see their own meetings, manually uncheck it

Members with "Meeting Record Management Permission" who only want to view their own meetings can filter using the API parameter `?scope=mine`.

FAQ

A colleague says they can't see a meeting I created?

Add them to the meeting's participants roster — it takes effect immediately.

How do I record customers or vendors who attend a meeting?

Add their names under "External Participants." This is only a roster and does not let them access the meeting content. If the person is an organization member, add them to the "Participants" roster instead to grant viewing access.

After unchecking "Meeting Record Management Permission", can I still see old meetings?

You can only see meetings you created and meetings where you were added to the participants roster. Meetings created by others that you were not added to will disappear from the list — if needed, ask a participant of that meeting to add you.

AI Meeting Summary & Q&A

Meeting summaries are processed in the background, so you do not need to remain on the summary page while a long meeting is being processed. You can leave the page during generation and return later to check the progress. When processing is complete, the summary is created as a new version.

Use Case

A project manager has just finished a long quarterly meeting and wants to organize the decisions before leaving work. She opens the **Meeting Summary** tab for the meeting and starts generating a summary with the default template. After seeing that the system is analyzing the transcript, she leaves the page to work on other tasks. When she returns to the same meeting later, the page continues to display the progress. Once processing is complete, she can review the decisions and action items in the newly created summary version.

Custom Summary Agent

The meeting records summary feature lets you select a custom AI assistant (Agent) to generate summaries. Different Agents can have different role instructions to produce summaries in different styles:

General Summary Agent: Organize meeting highlights, decisions, and action items

Technical Meeting Agent: Focus on technical decisions, architecture discussions, and technical debt items

Business Meeting Agent: Focus on client requirements, sales progress, and opportunity tracking

Generate a Summary

Go to the meeting detail page

Switch to the **Meeting Summary** tab

To customize the summary format, select the AI assistant to generate the summary; if none is selected, the default template is used

Click **Generate Summary**

The AI uses the complete transcript to organize the meeting highlights, decisions, and action items. When you use the default template, the page displays the **Analyzing transcript N/M** status followed by the summary compilation status. N represents the number of completed segments, and M represents the

total number of segments. When you select a custom AI assistant, the assistant processes the transcript directly and the segmented N/M progress is not displayed.

Whether you use the default template or a custom AI assistant, you can leave the page while processing continues in the background. Refresh the page or return to the meeting later to see the current status.

Leave the page and return later to continue viewing the default template's segmented progress

When the summary is complete, the new version appears in the version list

When the summary is complete, a new version is created automatically; you do not need to save it separately. If generation fails, the page prompts you to try again. Confirm that the transcript is available, then click **Regenerate**.

Summary Version Management

Each time a summary is generated or edited, the system retains a complete version history:

Add Summary: Each summary generation creates a new version

Edit Summary: Modify existing summary content

Version History: View all summary versions and their creation times

Delete Summary: Remove unwanted summary versions

Copy a Summary

When viewing a saved summary, a **Copy Summary** button appears in the toolbar above it. Use the button to copy the entire summary to the clipboard without manually selecting all the text, making it easy to paste into email, documents, or messaging apps.

Go to the meeting detail page and switch to the "Meeting Summary" tab

Select a saved summary

Click **Copy Summary**

After the "Copied successfully" notification appears, paste it into another application

The toolbar in the "Meeting Summary" tab

The summary's original text is copied with its paragraph structure preserved.

Copy Summary is available only when viewing a saved summary. It does not appear while editing a summary or previewing an unsaved draft. The button is disabled when the summary is empty.

If "Copy failed" appears, the browser has usually blocked clipboard access. Select and copy the text manually instead.

Read a Summary Aloud

When reading is inconvenient, have the system read the summary aloud. When viewing a saved summary, a **Read Aloud** button appears in the toolbar. Click it to hear the summary.

Go to the meeting detail page and switch to the "Meeting Summary" tab

Select a saved summary

Click **Read Aloud**. The button displays "Preparing..." before playback begins

During playback, click **Pause** to pause, **Resume** to continue, or **Stop** to end playback

During playback, "Read Aloud" changes to "Pause" and "Stop"

Before playback, the system automatically removes Markdown symbols such as `#`, `*`, and `-` from the summary so they are not read aloud.

Voice and Supported Languages

The voice is determined by **the meeting's spoken language or target translation language**, not by the actual language of the summary. The following seven languages are currently supported:

Language	Language Code
Traditional Chinese (Taiwan)	zh-TW
English (United States)	en-US
Japanese	ja-JP
Korean	ko-KR
Thai	th-TH
Indonesian	id-ID
Vietnamese	vi-VN

If the meeting language is not on the list above, such as Simplified Chinese zh-CN or Cantonese zh-HK, the toolbar displays a message saying that the language is not currently supported and the default language will be used. You can still use Read Aloud, but it uses a Traditional Chinese voice.

Limitations

- Read Aloud** is available only when viewing a saved summary; it does not appear while editing a summary or previewing an unsaved draft
- The button is disabled when the summary is empty
- Playback stops automatically when you switch summary versions or leave the "Meeting Summary" tab, so audio does not continue in the background
- The button is not displayed if the browser does not support audio playback
- If playback fails, "Text-to-speech failed. Please try again later" appears; try again later

AI Q&A

In addition to the summary feature, you can ask questions directly about the transcript content:

Switch to the "AI Q&A" tab

Select the AI assistant to use

Enter your question (e.g., "What decisions were made in this meeting?" "What are the next action items?")

The AI finds relevant content from the transcript and provides an answer

This feature is especially useful for quickly reviewing specific content from long meetings without re-reading the entire transcript.

AI Q&A Tab

Agent Ticket Creation

After a meeting ends, action items and decisions usually need to be manually entered into a project management or ticketing system. You can let the AI assistant handle this step: in the **AI Q&A** tab, ask it to turn the items discussed in the meeting directly into tasks or tickets.

Meeting Records does not have a dedicated "Create Ticket" button. **AI Q&A** uses the full AI assistant conversation, so as long as the selected AI assistant is configured with tools that can create tickets, you can ask it to create tickets in the conversation — the ticket creation capability comes from the AI assistant, not from Meeting Records.

How It Works

Step	Details
① Meeting Transcript	Meeting transcription is complete, and the transcript has been uploaded to the knowledge base and parsed
② Select AI Assistant	In the AI Q&A tab, select an AI assistant configured with ticket creation tools
③ Issue Ticket Creation Command	For example, "Compile the action items from this meeting and create a ticket for each one"
④ AI Assistant Calls Tools	The assistant calls API tools or MCP tools based on the field mappings and ticket creation rules in its role instructions
⑤ Create Tickets	Tickets are written to your company's ticketing or project management system
⑥ Report Results	The assistant reports each ticket's number and link in the conversation

Prerequisites

Condition	Description
Meeting is linked to a knowledge base, and transcript parsing is complete	AI Q&A requires the transcript to be in the knowledge base before it can be used. You can link a knowledge base when creating a meeting ; if not set at that time, you can also select a knowledge base in the AI Q&A tab and click Upload Transcript . See Download and Knowledge Base Integration for details
An AI assistant configured with ticket creation tools	The tool, not Meeting Records, is what actually calls the ticketing system. See the setup steps below
Ticketing system provides a callable API	MaiAgent communicates with external systems via API tools or MCP tools, without being limited to any specific vendor; as long as the other party provides an API for creating tickets, it can be integrated

Setup Steps

Create a ticket creation tool: On the [Tools](#) page, click [Add API Tool](#) and configure your company's ticketing system's "Create Ticket" API (you can paste a cURL command directly and the system will automatically parse the URL, headers, and HTTP method). See [Create API Tool](#) for details. If the other party provides an MCP server, you can also use [MCP Tool](#) instead.

Assign the tool to the AI assistant: Add the newly created tool to the AI assistant's available tools list. See [Configure Tools for AI Assistant](#).

Define ticket creation rules in the role instructions: Whether the AI calls the tool at the right time and how fields are filled depends on the role instructions. Refer to the example below, and see the [Role Instructions Design Guide](#) for writing principles.

Use in meetings: Go to the **AI Q&A** tab on the meeting detail page, select this AI assistant, and issue a command directly, such as "Compile the action items from this meeting and create a ticket for each one."

Ticket creation writes to an external system. It is recommended to verify field mappings with a test project or test environment before switching to your production ticketing system.

Role Instructions Example

```
# Role
You are a meeting action item ticketing assistant.

# Task
Users will ask you to create tickets based on meeting transcripts. Follow this process:

1. Identify clear action items and decisions from the transcript; ignore pure discussions or items that haven't been finalized
2. Organize each action item into a ticket with the following field mappings:
  - Title: One sentence describing what needs to be done, under 30 characters
  - Content: Add the background and rationale mentioned in the meeting
  - Assignee: The person explicitly assigned in the transcript
  - Due date: The date explicitly mentioned in the transcript
3. Before calling the tool, present the compiled ticket list to the user for confirmation; only create after getting approval
4. After creation, report each ticket's number and link

# Constraints
- Only create tickets based on transcript content; do not add tasks that were not discussed
- If the assignee or due date cannot be determined from the transcript, leave blank and note it in the response; do not guess
- When the same item is mentioned multiple times in the meeting, merge into a single ticket
```

Verification and Troubleshooting

The parameters actually received by the tool and the returned results can be viewed in AgentOps' [Tool Execution Records](#) — this is the fastest way to troubleshoot ticket creation issues.

Issue	Cause and Resolution
AI Q&A is unavailable	The meeting is not linked to a knowledge base, or the transcript is still being parsed. Select a knowledge base in the tab and upload the transcript, then try

Issue	Cause and Resolution
	again after parsing is complete
AI listed the action items but did not actually create tickets	The tool was not added to the assistant's tool list, or the role instructions do not explicitly require calling the tool. Check steps 2 and 3
Ticket creation failed	Check the error message in the tool execution records. Common causes include missing required fields, expired authentication, or insufficient permissions
Ticket field content is incorrect	Make the field mapping rules more specific in the role instructions, and explicitly instruct it to leave fields blank rather than guess when information cannot be determined
AI's response is unrelated to this meeting	The currently selected AI assistant may not be linked to this meeting's knowledge base; the interface will show a reminder. Switch to a linked assistant

Download & Knowledge Base Integration

Download Files

After meeting processing is complete, you can download the following files:

Format	Description	Use Case
MP3 Audio	Meeting recording in MP3 format	Archiving, offline playback
Plain Text Transcript	Complete transcript in plain text format	Copy and paste, document archiving
SRT Subtitle File	Transcript in subtitle format with timestamps	Video playback, subtitle import

On the meeting detail page, go to the "Download" tab and click the corresponding download button to get the file. The plain text transcript can also be copied with one click from the "Plain Text" tab.

Download Tab

Upload to Knowledge Base

After uploading the meeting transcript to the knowledge base, the Agent can answer questions based on meeting content:

On the meeting detail page or list page, select "Upload to Knowledge Base"

Select the target knowledge base (if a knowledge base was linked when creating the meeting, it will be pre-filled)

Confirm the upload

After uploading, the transcript becomes a document in the knowledge base, and the Agent can retrieve meeting discussion content through RAG.

Use Cases

Project Meetings: Import each project meeting transcript into the knowledge base so the Agent can answer "What was decided in the last meeting?"

Client Interviews: Import client interview records for easy reference of client requirements

Training Records: Import internal training content to build an organizational knowledge base

Customer Service Conversations & Platform Integration

Choose an Integration Platform

MaiAgent AI assistants can connect to different types of conversation platforms based on your needs. Whether serving external customers or supporting internal employees, they can be used flexibly. The following sections explain the purpose and use of each integration option:

Default System Interfaces

When you create an AI assistant, the system automatically creates the following three platform interfaces:

API: Provides a programmatic interface for developer integrations

Web: A built-in web chat interface that can be embedded directly into a website

Internal: A Q&A platform for internal enterprise users

Public Channels

These channels are designed for external services, allowing the AI assistant to serve as the first point of contact between your organization and the public:

Conversation Platform Integration: Website

Function: Embed the AI assistant in your corporate website

Use cases: Respond to visitor questions in real time and provide product information, service details, answers to frequently asked questions, and more

Advantage: Provide 24/7 online customer service and improve website conversion rates

Conversation Platform Integration: LINE

Function: Integrate with your company's LINE Official Account

Use cases: Provide customer service, user engagement, and other features through the familiar LINE messaging interface

Advantage: Reach LINE's broad user base and lower the barrier to customer adoption

Conversation Platform Integration: FB Messenger

Function: Connect to Messenger for a Facebook Page

Use cases: Respond to customer questions in real time through social platforms and handle order inquiries, event questions, and more

Advantage: Integrate with social media marketing and increase follower engagement

Conversation Platform Integration: Instagram

Function: Connect to direct messages for an Instagram professional account (authorized through a linked Facebook Page)

Use cases: Respond to direct-message inquiries generated by posts and Stories, and handle common questions about products, events, reservations, and more

Advantage: Share the same authorization flow as FB Messenger and link both to the same AI assistant for unified responses

Conversation Platform Integration: Telegram

Function: Create a Telegram Bot to provide customer service

Use cases: Support one-on-one conversations and group discussions, making it ideal for technical communities and international customer service

Advantage: Simple connection setup, intelligent group responses, conversation resets, and other practical features

Internal Use Only

These channels support internal knowledge inquiries and processes to improve team efficiency:

Internal Q&A

Function: Restrict the AI assistant to internal personnel, who access it from "Agent Marketplace" in the left-hand menu

Use cases:

Connect internal documents or policy databases

Help employees quickly look up company policies and process instructions

Look up HR policies and SOP operating instructions

Support new employee training

Advantage: Create an intelligent enterprise knowledge hub and reduce repetitive inquiries

API Integration

Function: Integrate with internal enterprise systems through APIs

Use cases:

Integrate with ERP and CRM systems

Connect internal workflow platforms

Develop custom applications

Advantage: Integrate deeply with existing systems to provide a seamless user experience

Internal Q&A Features

Introduction to Internal Q&A

Internal Q&A uses the built-in **Internal** channel that is automatically created when you create an AI assistant. No integration setup is required. Organization members can select an assistant from the **Agent Marketplace** in the left menu to open this page. Under **All Conversations**, the source of these conversations is shown as **Internal**.

Conversation area

Chat with an AI assistant in real time

Conversation history

View and manage all past conversations

AI assistant selection

Switch between AI assistants for conversations

AI assistant settings

Adjust the AI assistant's permissions, tool configuration, and other settings for the current conversation in real time

Displayed only when you have permission to edit the assistant

Knowledge base document management

Precisely control which documents the AI assistant can reference in each conversation

How do I use Internal Q&A?

1. Open the Internal Q&A page from the Agent Marketplace

Click **Agent Marketplace** in the left menu, then select the AI assistant you want to chat with to open this page.

2. Select an AI assistant

Use the **blue drop-down menu** in the upper-left corner to select the AI assistant you want to chat with.

3. Start a conversation

Continue a previous conversation: Select a topic from the previous Q&A topics on the left.

Start a new conversation: Click **New Q&A** in the left panel to start a new conversation.

All conversations appear in the Q&A history in the upper-left corner.

After selecting a conversation, enter your question in the text box below to start chatting.

Continue a previous conversation (select a conversation)

Start a new conversation (new conversation)

4. Customize the document reference scope (optional)

Use the knowledge base management feature on the right to select the specific documents the AI assistant can reference in this conversation.

You can select the reference documents and FAQs separately for each message
 You can change the selection before sending each question

Document access scope

When sending the first message, allow access to all documents, including 氣氛燈-系列.md .

After referencing the document, the AI assistant responds: "Document content: The official website has been closed, and no products are sold externally anymore."

When sending the second message, clear the selection for 氣氛燈-系列.md .

The AI assistant cannot reference it and responds: "I can't find the specific content of the 氣氛燈-系列.md file."

FAQ access scope

When sending the first message, allow access to all FAQs, including "How do LLMs work?"

The AI assistant references the FAQs and provides a relevant answer.

When sending the second message, clear the selection for "How do LLMs work?"

The AI assistant cannot reference "How do LLMs work?" and responds, "I can't find any information about how LLMs work in the FAQs."

Filter by label

Use labels configured in the knowledge base to filter the documents that the AI assistant can reference:

For label configuration instructions, see [Document management: Labels and metadata](#).

a. Click **Show Label Filter** in the upper-right corner.

b. Select the matching method: Click **Include all labels (AND)** or **Include any label (OR)** to switch between them. (The image below shows the previous version's AND/OR buttons in the same location.)

c. Add labels.

Filter using **Include all labels (AND)**

Documents: Only **進階露營.pdf** meets all criteria and is available for the AI assistant to reference

FAQs: No FAQ meets all criteria, so none are displayed

The label filter applies to both documents and FAQ content. These settings affect only this conversation. To apply the same criteria by default across all conversation platforms, configure [Knowledge base label filtering](#) on the assistant settings page.

5. Adjust AI assistant settings in real time (optional)

Use **AI Assistant Settings** in the upper-right corner to modify permissions, tools, and other configurations in real time.

Click it to open a panel on the right, where you can edit the required permissions, tools, and other settings.

Who can see the AI Assistant Settings button?

This button is displayed based on your permission to edit the **currently selected assistant**. If you do not have edit permission, the button does not appear, but you can still chat with the assistant as usual.

Your identity	Is the button displayed?
Organization owner	✓ Always displayed
Your role has Allow editing permission for the assistant	✓ Displayed
Your role can only view the assistant	✗ Not displayed; Q&A only
You do not have permission to use the AI Assistant feature	✗ Not displayed

Permissions are determined separately for each assistant. When the same person switches between assistants on the same page, the button may appear or disappear. This is expected behavior.

The button appears only after the permission check is complete. A brief delay after switching assistants is expected.

Organization administrators grant edit permission separately for each assistant by selecting **Allow editing** for that assistant on the **Assign AI Assistants** tab under **Role Permission Management**. For configuration instructions, see [Role resource access permissions](#). Changes take effect after the member refreshes the page.

If you need to edit an assistant but cannot see this button, contact your organization administrator and ask them to enable Allow editing for that assistant for your role.

Tips

Conversation management

Use the conversation history to quickly return to previous discussions

Use New Q&A to start a completely new topic

Precise document control

Limit the reference documents for specific questions to get more precise answers

Prevent irrelevant documents from affecting the AI assistant's response

Flexible settings

Adjust the AI assistant's capabilities in real time for different conversation scenarios

Test how different settings affect response quality

Web Chat Overview

1. What is WebChat?

You can embed AI assistants created on MaiAgent into your website to provide real-time customer service or other conversations. Web Chat features a **responsive design that adapts perfectly to desktop, tablet, and mobile devices**.

MaiAgent currently offers the following three embedding methods:

1. Bottom-Right Corner Widget

Embed into your website as a built-in smart assistant

Non-intrusive to normal browsing, available whenever needed

Ideal for general customer service and consultation

Bottom-right corner embed (draggable window)

2. Full-Screen Embed

Provides a complete conversation experience

Suitable for complex consultation and service workflows

Customizable design to meet enterprise needs

Full-screen embed demo

3. MaiGPT Window Mode Embed

A full ChatGPT-style conversation interface (conversation history list on the left + main conversation area on the right) that can be embedded directly into a page as the primary UI

Can be permanently displayed in a specified container, or opened full-screen by clicking a floating button in the bottom-right corner

Ideal for AI portal sites, internal knowledge portals, or as the primary conversation interface for a product

MaiGPT Window Mode: Full ChatGPT-style interface

MaiGPT window mode can be selected in the "**Embed**" window of the chat platform settings. For complete setup steps, see [MaiGPT Window Mode Embed](#).

This design delivers:

Immediacy: Visitors get professional answers instantly without waiting, enhancing user experience

Convenience: The floating bottom-right design doesn't interfere with normal browsing, available whenever needed

Cost Efficiency: AI assistant provides 24/7 service, significantly reducing labor costs

Professional Image: Demonstrates the enterprise's technological capabilities and service quality

2. Build a Brand-Styled Web Chat Service

MaiAgent offers customization features including custom logos, avatars, and Q&A theme colors to help you build a brand-styled Web Chat service

You can:

Choose the assistant display name

Upload your company logo

Choose the AI assistant display avatar
Select the Web Chat theme color
Select the message background color for AI assistant replies
to create your own Web Chat appearance:

Default style

Custom style

This way, you can create a Web Chat service that matches your brand colors and corporate identity

Web Chat displays the platform branding below the conversation input area. The login, registration, and loading screens also display the brand image at a consistent aspect ratio without compressing, stretching, or distorting it.

The brand logo at the bottom of Web Chat remains clear and preserves its aspect ratio

Dark Mode Optimization

MaiAgent's Web Chat dark mode has been fully optimized to provide a more comfortable visual experience:

Dynamic Color Adjustment

Automatically adjusts theme color brightness to ensure visibility on dark backgrounds

Intelligently adjusts text contrast for optimal readability

Optimizes icon and button colors for better visibility in dark mode

Contrast Optimization

Message bubble background colors are carefully designed to prevent visual fatigue

Links and important information use high-contrast colors for clear identification

Input field and button border colors are optimized to enhance the user experience

Seamless Switching Experience

Users can switch between light and dark modes at any time

Conversation content and operation states are preserved during switching

The system remembers the user's theme preference

Dark mode is particularly suitable for:

Nighttime use or low-light environments

Extended conversations to reduce eye strain

Enterprise brand designs with dark color schemes

3. Message Customization

When entering the Web Chat service for the first time, you can freely configure your AI assistant's opening message based on the following scenarios.

1. Greeting Customization

Branded Greeting

Set: "Welcome to our website! I'm your dedicated customer service assistant" to showcase your enterprise's professional image and friendly service attitude

Guided Opening

Set: "I can help you look up product information, answer usage questions, and assist with order processing" to clearly inform users of the available service scope and build trust in the service capabilities

Custom greeting

2. Guided Starter Questions

Set "**conversation starter questions**" as quick options

Users can directly click on common questions without typing

Example questions:

"How do I check my ordered items?"

"How do I place an order?"

"Membership points rules"

"Business hours"

Users can tap starter questions to begin a conversation, speeding up the Q&A process:

Starter question setup example

User taps to start conversation

Stop a Response While It Is Being Generated

If you notice an error in your question after sending it, you do not need to wait for the AI assistant to finish the entire response. While the response is being generated, the send button to the right of the input field changes to a square **Stop** button. Click it to stop the current response, then enter and send your corrected question.

For example, suppose a customer service representative asks the AI assistant to plan an annual product launch but realizes after sending the request that they forgot to specify the event budget. They can click **Stop** while the AI assistant is generating the response, then add the budget and number of attendees and ask again. This avoids waiting for content that does not meet their needs to finish generating.

Stop the Current Response

1. Find the Stop Button

After sending a question, wait for the AI assistant to start generating a response. A square **Stop** button appears to the right of the input field.

Click the Stop button to the right of the input field while a response is being generated

2. Stop and Ask Again

Click **Stop**. Once the "Typing a response for you" message disappears, enter the corrected question in the input field and send it again.

Stopping only interrupts the response currently being generated. It does not delete the question you sent or any previous conversation history.

4. Diverse Q&A Content

1. Multi-Language Support

Responds in the user's language, eliminating communication barriers.

Auto-detection: Selects the assistant's reply language based on the user's input language

Manual switching:

Use the Web Chat interface to select the language. See: [Multi-Language Support: Web Chat Chat Settings](#).

Use the Web Chat initialization script (JavaScript) to specify the AI assistant's reply language. See: [Technical Manual - Web Chat Initialization](#).

For the list of supported languages, see: [Multi-Language Support: Supported Language List](#)

2. Multimodal Q&A

In addition to text-based Q&A, the AI assistant also supports uploading different types of files:

Spreadsheets: .xls, .xlsx, .csv, .ods

Word processing documents: .doc, .docx, .odt, .pdf, .md, .txt

Presentation files: .ppt, .pptx, .odp

Web files: .html, .htm

Data formats: .json, .jsonl

Audio files: .wav, .mp3, .m4a, .aac

Video files: .mp4

You can disable file uploads for users, restricting conversations to text only to ensure conversation security.

Image Content Processing

Image Recognition and Analysis

Upload image analysis: Users can upload product images, and the AI automatically identifies and provides relevant information

Screenshot processing: Supports screenshot analysis to help resolve usage issues

Image descriptions: Automatically generates image content descriptions and related suggestions

Image Response Feature

Product image display: Replies include actual product images

Operation guide images: Provides step-by-step operation screenshots

Examples:

A user asks where to configure the MaiAgent assistant, and the assistant responds with an image of the settings screen

A user sends a screenshot to the assistant to confirm whether the path is correct, and the assistant correctly interprets and responds

Assistant responds with images

Assistant interprets user screenshot content

Document Processing Capabilities

Supported Document Formats

PDF files: Automatically parses PDF content and answers related questions

Word documents: Processes .doc/.docx format documents

Excel spreadsheets: Analyzes spreadsheet data and provides insights

PowerPoint presentations: Extracts presentation content and answers questions

Document Interaction Features

Document content queries: Answers specific questions based on uploaded documents

Data analysis: Automatically analyzes table data and provides statistical information in table format

Document summaries: Generates key content summaries for long documents

Example 1: Ask the AI assistant to present data content in table format and provide reference links

Information organized in table format

Providing external links

Example 2: Ask the assistant to analyze sales content and provide table analysis

Example 3: Upload a docx file and ask the assistant to help analyze CV writing issues

The AI assistant replies in Markdown format, organizing response content in a well-structured manner.

5. Conversation Memory and Sharing

1. Conversation History Memory

To provide a continuous service experience, WebChat automatically remembers users' conversation history, allowing each conversation to build upon previous ones.

Memory Scope

Conversation content: Complete Q&A records, including text, images, documents, etc.

Service status: Incomplete queries, pending issues

Users can view past conversation records in the conversation list on the left side of Web Chat, or start a new conversation

The conversation memory feature can be used for:

Continuous consultation: When a user asks "What tent model did you recommend last time?", the AI can immediately recall and answer

Progress tracking: When a user says "Continue the order inquiry from last time", the AI automatically retrieves the relevant information

Personalized service: Provides more accurate recommendations and suggestions based on conversation history

2. Conversation Sharing

When you want to share a conversation with friends or colleagues after consulting the AI assistant, or when internal teams need to collaborate on customer issues, you can use MaiAgent's service to generate a conversation sharing link:

根據文件 `cv_revised_01082025.docx`，我發現以下幾個問題：

MAIAGENT

Shared Content

Complete conversation record: Includes all text, images, documents, and other content

Conversation summary: Automatically generated conversation highlights summary

Related resources: Product links, documents, etc. mentioned in the conversation

Conversation record sharing can be used for:

Customer sharing: "This camping gear recommendation is great, share it with the hiking club"

Internal collaboration: Customer service staff share complex issues with the technical support team

Training purposes: Share typical conversation cases as employee training materials

3. Conversation Timeout Management

To ensure conversation quality and system performance, Web Chat features an intelligent conversation timeout management mechanism:

Intelligent Filtering Mechanism

Automatic greeting filtering: The system identifies and filters opening greetings, excluding them from conversation timeout calculations

Correct message count reset: When a conversation restarts, the message counter resets correctly

Optimized timeout determination: Timeout calculations only apply to substantive conversation content, providing more accurate conversation management

Conversation Continuity Assurance

Ensures users do not unexpectedly time out during normal conversations

Conversations can continue after extended periods of thinking or pauses

The system intelligently determines whether a conversation is still in progress

How It Works

Start conversation: The user sends a greeting (e.g., "Hello"), which the system does not count toward the timeout

Enter conversation: The user begins asking substantive questions, and the timeout timer starts

Conversation pause: If the user temporarily leaves, the system maintains the conversation state

Resume: The user returns to continue the conversation, and the message count updates correctly

This optimization makes the conversation experience smoother and more natural, so users don't need to worry about interruptions due to extended thinking time.

6. Choose Whether to Display Tool Usage and Citation Lists

1. Display Tool Usage List

You can choose whether to let users see the list of tools the AI assistant uses during reasoning. If enabled, the following screen appears when the AI assistant generates a response:

You can use this list to verify whether the AI assistant is using the correct tools.

2. Display Citation List

Each AI response automatically generates a citation list, clearly indicating information sources to enhance the credibility and traceability of answers.

Display Settings

Enterprises can configure whether to let users see the tool usage list and reference document names. If display is enabled, the following list appears at the bottom of the AI assistant's response. Clicking on a "citation node" reveals the referenced document excerpt:

Depending on different usage scenarios, you can choose whether to display citation information:

Public customer service: Display all citation information to build trust

Internal support: Hide sensitive documents to protect confidential information

Educational institutions: Display learning resources for convenient student reference

7. Conversation Access Control - A Secure and Controllable Conversation Environment

1. Login Configuration

Mandatory Login Mechanism

To ensure the security and controllability of conversation content, enterprises can enable the login feature, requiring users to log in before using the AI assistant service. Once configured, visitors clicking on WebChat will first be directed to a login page, and only successfully authenticated users can begin conversations with the AI assistant

Security Advantages

Identity verification: Ensures every conversation user has a verified identity

Access control: Provides corresponding service content based on user identity

Conversation tracking: Maintains complete conversation history records for each user

Data protection: Prevents unauthorized users from accessing sensitive information

2. Three Login Methods

AD (Active Directory) Login

Use case: For internal employees, integrated with existing AD systems

Features: Single Sign-On (SSO), no additional account management needed

Setup: Configure AD server connection information and synchronization rules

Practical application: Employees log in directly with company accounts and automatically receive corresponding permissions

Keycloak Login

Use case: For enterprises requiring complex identity management, supporting multiple identity providers

Features: Supports standard protocols such as OAuth2, SAML, and OpenID Connect

Setup: Configure Keycloak server, user pools, and identity providers

Practical application: Integrate user identities across multiple systems with unified permission management

MaiAgent Login

Use case: For simple user management needs with quick deployment

Features: Built-in user management system, simple and intuitive operation

Setup: Create user accounts and permissions on the MaiAgent platform

Practical application: Create a dedicated login system for specific user groups

Once enabled, the following screen will appear before starting a conversation, requiring login:

[還沒有帳號? 立即註冊](#)

8. Data Collection (Pre-chat Form)

After data collection is enabled, visitors see a form before starting a conversation and must complete it to continue. Their responses are saved to the visitor's contact, so customer service agents can view them directly on the conversation page. This is useful when you need to identify visitors in advance. For example, distributor support can collect a company name and business registration number, while event inquiries can collect a name and email address.

1. Configure the Data Collection Form

Path: **Customer Service** → **Conversation Platforms** → select the Web Chat conversation platform → **Data Collection** tab.

Data Collection tab: configure the toggle, title, and fields on the left; the Live Preview on the right updates the form's appearance in real time

Enable the Form

Turn on **Enable Pre-chat Form**. When it is disabled, visitors enter the conversation directly, following the original flow.

Set the Title and Subtitle (Optional)

Form title: Appears at the top of the form. If left blank, the system uses the default text "A few questions before we start."

Form subtitle: Descriptive text for the form. Use `{name}` to insert the conversation platform name. If left blank, the default text is "Leave your information so {name} can provide more personalized service."

Both fields support multiple languages. Switch language tabs to enter each translation separately.

Add Fields

Click **Add Field**. You can configure the following options for each field:

Setting	Description
Field type	Text, Email, Phone, or Dropdown
Field label	The field name visitors see; enter a separate label for each language
Placeholder	Gray hint text displayed inside the field
Required	When selected, visitors cannot submit the form without completing the field
Contact field mapping	Determines where the data is stored in the contact: Name (Contact.name) , Email (Contact.email) , Phone (Contact.phoneNumber) , or Custom Field (Metadata)

Dropdown fields also have an **Options** list. Select **Allow custom "Other" input** to let visitors enter their own response after selecting "Other."

Configure each field's type, localized label, placeholder, Contact field mapping, and required status

Drag fields to reorder them. A form can contain up to 10 fields. The preview area on the right updates the form's appearance in real time. Switch the **Preview Language** to check each language version.

Save

After confirming that the preview is correct, save the form. The changes take effect immediately in Web Chat.

Contact field mapping restrictions Name can only map to a Text field, Email can only map to an Email field, and Phone can only map to a Phone field. Incompatible field types are disabled with an explanatory message. Name, Email, and Phone can each be mapped by only one form field. For all other fields, such as business registration number or company name, select Custom Field (Metadata).

2. Visitor Form Flow

When visitors open Web Chat, they first see the form with its title, subtitle, configured fields, and a language selector in the upper-right corner. After completing the form, they click [Start Conversation](#) to enter the conversation.

開始對話

Click Start Conversation after completing the form

If a required field is empty or an email address or phone number has an invalid format, an error appears below the field and the form cannot be submitted.

After completing the form once in a browser, the visitor will not be asked to complete it again when opening the same Web Chat.

To correct their information, visitors can open the **:** menu in the upper-right corner of Web Chat and click **Refill Information**. The form appears again.

Refill Information in the upper-right **:** menu

3. Use with Login: Associate Data with a Login Account

If the same Web Chat has both the login feature and data collection enabled, the flow is: **Log in → Fill out the form → Start the conversation**. The information entered by the user is associated with their login account rather than the browser.

On the "Login Settings" tab, enable "Enable Login" and select a login source; these settings are independent of the "Data Collection" tab

② The data collection form appears only after login

Situation	Web Chat behavior
The account is being used for the first time and has not completed the form	The form appears after login. Once submitted, a contact associated with the account is created.
The same account logs in on a different device or browser	The form does not appear again. The conversation starts immediately using the account's existing information.
The form was previously completed on this device while logged out, but the account has no information	An "Is this information yours?" confirmation screen appears (see below).
The account already has information, and this device has separate information entered while logged out	The account information takes precedence. The system does not ask for confirmation or merge the records.
A logged-in user clicks Refill Information	The existing contact associated with the account is updated; a new contact is not created.

Confirmation screen: Is this information yours?

If someone previously completed the form on this device without logging in and the account currently logging in has no information, the form does not appear immediately after login. Instead, a confirmation screen appears first. It displays the information previously entered on this device, with some details masked, and provides two buttons:

Yes, this is mine: Associates that information with the current account. The user will not need to complete the form again when logging in to the same account on any device.

No: Does not merge the records. The original information remains unchanged, and the form then appears for the user to complete.

這筆資料是您的嗎？

我們發現這台裝置先前填過的資料。這是您本人留下的嗎？選「是」會把它掛到您的帳號，之後換裝置登入就不必再填。

您在這台裝置留下的資料（部分顯示）：

姓名	陳大****
統一編號	12345****
Email	dahua****

是，這是我的

不是

The confirmation screen masks some details, showing only enough information for users to determine whether they submitted it

Web Chats without the login feature enabled are unaffected and continue to use the browser to determine whether the form has already been completed. The system does not automatically populate the form with account information. The first time an account is used, the user is still asked to complete the form even if their information already exists in the admin console.

After the conversation starts, both the AI assistant and customer service staff see the contact associated with the account:

The AI assistant addresses the user by the name entered in the form

The conversation page in the admin console displays the contact and the business registration number collected through the form

4. View Collected Information in the Admin Console

View in a conversation: Go to [Customer Service](#) → [All Conversations](#) → open a conversation. The [Contact Information](#) section on the right lists each item collected through the form. Fields mapped to email and phone are displayed as "Email" and "Phone Number," while custom fields use the field labels you configured.

搜索引擎

The "Contact Information" section on the right side of the conversation page lists each item collected through the form

The "Contact" column in the contact list displays the contact's name. If the form's name field is mapped to "Custom Field (Metadata)" rather than "Name (Contact.name)," contacts for visitors who are not logged in are displayed as "Anonymous," and the name appears only in the custom attributes. To display visitor names directly in the list, map the name field to "Name (Contact.name)."

View on the contact page: Go to **Customer Service** → **Contacts** → open a contact. The **Basic Information** tab displays the name and phone number, while the **Custom Attributes** tab displays the other form fields.

Search the contact list by name, email, or phone number

The "Custom Attributes" tab lists the value of each form field

Information entered by a logged-in user is associated with their account, so the contact is no longer an unclaimed anonymous contact. The contact name depends on the form configuration: if the name field is mapped to "Name (Contact.name)," the name entered in the form is displayed; if the form does not have a name field, the login account's name is displayed.

What Should I Do If the Connection Fails?

For example, a website administrator may receive a report from a visitor that Web Chat displays a connection error when opened. The visitor should first wait for the system to retry automatically. If the error screen remains, they should capture the entire screen, including the failed stage, error category, and time of occurrence, and send it to the administrator so the issue can be diagnosed more quickly.

If the network connection is interrupted while Web Chat is loading the AI assistant settings, it automatically retries first. The loading screen remains visible during this time. If it still cannot connect after retrying, the error screen displays:

The loading stage that failed

The error category, along with the HTTP status code when available

The local time when the error occurred

If automatic retries fail, the screen lists the failed stage, error category, and time of occurrence

If the system has received an HTTP error status code, the server has already responded. In this case, it does not retry automatically and displays the diagnostic error screen immediately.

First, confirm that the device can access the internet, then click **Retry** on the error screen. If the problem persists, include all diagnostic information in the screenshot and make sure that no conversation content or personal information is visible.

Review Earlier Messages While a Response Is Being Generated

While the AI assistant is still generating a response, visitors can scroll up to review earlier messages. The response continues to be generated below, but the view remains at the visitor's current scroll position instead of being pulled down by newly generated text. As soon as the visitor leaves the latest position, a **Back to Latest** button appears above the input box.

Scenario

A visitor asks the AI assistant to compare several options at once. Before the response is complete, she wants to check the price of the first option, so she scrolls up. The view stays where it is and does not jump as more text appears below. After checking the price, she clicks **Back to Latest**. The view returns to the position of her latest question so she can continue reading the rest of the comparison.

How to Use It

1. Scroll Up

While the AI assistant is generating a response, scroll up using the mouse wheel, a touch gesture, or by dragging the scroll bar.

2. Read at Your Current Position

The view remains at the position you scrolled to. Newly generated content does not change your current position.

The response is still being generated (the square Stop button appears on the right side of the input box). After you scroll up, "Back to Latest" appears above the input box

3. Return to the Latest Message

Click [Back to Latest](#). The view returns to the position of the latest question and resumes automatically following new content.

Integrate with Platform: Website

I. Open the Settings Page

1. Path 1: Add a Web Customer Service Chat

In the left menu, click “Customer Service Chat > Chat Platforms,” click “+ Integrate Chat Platform” in the upper-right corner, and select “Website.”

2. Path 2: Access a Chat Platform Associated with an AI Assistant

In the left sidebar, go to **AI Features** → **AI Assistants**, select the assistant you want to configure, and switch to the **Chat Platforms** tab. Find the website chat platform you want to adjust, then click **Platform Settings**.

Click “Platform Settings” on the AI Assistant's Chat Platforms tab.

After completing the settings, click **Back to AI Assistant Settings** at the top of the page to return to the original assistant's **Chat Platforms** tab. This return option remains available when switching between **Basic**, **Quota**, and **Auto-Reply Settings**.

After completing the settings, return directly to the original AI Assistant settings page.

[Back to AI Assistant Settings](#) is displayed only when you access the page from the AI Assistant's **Chat Platforms** tab. If you access it directly from **Chat Platforms** in the left menu, the page retains its original navigation.

Use Case: Return to the Assistant After Updating Website Customer Service

A customer service manager needs to update the website customer service settings for the “Product Consultation Assistant.” She clicks **Platform Settings** on this AI Assistant's **Chat Platforms** tab. After making the changes, she clicks **Back to AI Assistant Settings** to return to the same assistant's chat platform list and continue checking other customer service channels, without having to find the assistant again in the AI Assistant list.

3. Path 3: Chat Platform Operations

In the left sidebar, go to “**Customer Service Chat > Chat Platforms,**” select the AI Assistant you want to configure, and click the “**Operations**” icon to open the chat platform configuration.

II. Basic Settings

The five categories in the “General” group of the “Basic” tab each have a dedicated page with detailed instructions:

1. Basic Settings

For the platform name, AI Assistant, return URL, custom domain, allowed embed domains, public access URL, and three embedding methods, see [Basic Settings](#).

Allowed Embed Domains

For how the embed allowlist works, setup steps, and a pre-enablement checklist, see [Basic Settings: Allowed Embed Domains](#).

2. Appearance Settings

For the logo, avatar, display settings, and light/dark theme colors, see [Appearance Settings](#).

3. Feature Settings

For enabling the platform, allowing file uploads, cited documents, OCR, tool display mode, question-set option display mode, and AI awareness settings, see [Feature Settings](#).

4. Interaction Settings

For the greeting, conversation starter questions, including greeting options in the Agent context, conversation display settings, satisfaction surveys, and quota-exhausted messages, see [Interaction Settings](#).

Include Greeting Options in the Agent Context

For differences before and after enabling it, use cases, and important notes, see [Interaction Settings: Include Greeting Options in the Agent Context](#).

5. Login Settings

Configure the SSO Login Source

MaiAgent currently supports SSO (Single Sign-On) through Keycloak integration

Switch the source using the “**Login Source**” dropdown menu

Select Maiagent or Keycloak as the authentication method

Passwordless Chat from an Embedded Client

If you embed Web Chat on your website and users are already logged in there, enable “**Allow Passwordless Chat from Embedded Clients Using Source ID**” so they can start chatting immediately. For setup and signature integration instructions, see [Passwordless Chat Using a Contact Source ID](#).

III. Auto-Reply Settings

You can configure when the bot replies here.

Click the toggle next to a date to select the days of the week on which replies are sent.

Set a time period by selecting its start and end times.

To configure multiple time periods, click “**+ Add Time Period**,” then set the period.

Passwordless Conversations with Contact Source ID

When Web Chat is embedded in your website, users are often already signed in. This setting lets them start a conversation with your system's user ID without another sign-in screen, while continuing to block anonymous access through the public conversation URL.

MaiAgent calls this ID the **Source ID**. After receiving it, the platform maps it to (or creates) a **contact** and associates the user's conversation history with that contact.

1. What This Setting Solves

Previously, sign-in settings required one of two options:

Enable sign-in: users were asked to sign in again even though the embedded site had authenticated them.

Disable sign-in: anyone could anonymously use the public conversation URL.

After enabling this setting, users with a Source ID and valid signature can chat directly, while all other visitors are redirected to the sign-in page.

This setting is disabled by default. When disabled, all existing behavior remains unchanged.

2. Enable the Setting

Go to “**Customer Service Conversations > Integration Platforms**” in the left menu, select a website integration platform, and open the “**Login Settings**” tab.

1. Select a login source first

First select a “**Login Source**” (MaiAgent, AD, Keycloak, or LINE). Until then, the toggle is unavailable and displays “**Please select a login source first.**”

The toggle is disabled by default on the Login Settings tab

2. Enable the toggle

Enable “[Allow embedded clients to start conversations without signing in by using a Source ID.](#)” The verification method, signing secret, and integration examples then appear.

The expanded settings; “Require signature verification” is selected by default

3. Select a verification method

Verification method	Description	Recommended use
Require signature verification (recommended)	The embedded client must include a signature generated by your backend. Only a server holding the secret can initiate a conversation for a user.	Production
Source ID only	No signature is verified; a Source ID grants access.	Testing or closed intranets

With “Source ID only,” the Source ID is an access credential. If it is guessable, such as an email address, student number, or employee ID, someone could impersonate that user and read their history. Use signature mode when identity assurance is required, or use AD, Keycloak, or MaiAgent login.

A red risk warning appears when “Source ID only” is selected

4. Obtain the signing secret

After selecting signature mode and saving, the platform generates a signing secret. You can:

Click **Show** to view the full secret (masked by default)

Click **Copy** to provide it to your engineer

Click **Regenerate** to issue a new secret

Store the secret in a server environment variable. Never place it in frontend code. Regenerating it immediately invalidates the old secret; update your backend at the same time or every signature will fail.

5. Set the signature validity period

Choose 1, 5, or 15 minutes. The default is 5 minutes. Expired or previously used signatures are rejected.

Signing secret, validity period, integration examples, and behavior preview

The validity period limits how long the signature can be used to open a conversation; it is not the conversation lifetime. Once identity is established, the user is not signed out after five minutes.

3. Integration Instructions for Engineers

The “[Integration Examples](#)” section includes this platform's ID and can be copied directly. For complete parameters, rules, and troubleshooting, see [Web Chat Embed](#) and [SDK • Signature Verification](#).

1. Calculate the signature on the backend

The signature is `HMAC-SHA256(secret, "{integration platform ID}.{Source ID}.{timestamp}")`, passed as a hex string. Your backend generates the Unix timestamp in seconds (UTC).

PHP

```
{% code overflow="wrap"
```

```
$ts = time();
$sig = hash_hmac('sha256', "{$webChatId}.${sourceId}.${ts}", $SIGNING_SECRET);
```

Node

{% code overflow="wrap"

```
const ts = Math.floor(Date.now() / 1000);
const sig = crypto.createHmac('sha256', SIGNING_SECRET)
    .update(`${webChatId}.${sourceId}.${ts}`).digest('hex');
```

Python

{% code overflow="wrap"

```
ts = int(time.time())
sig = hmac.new(SIGNING_SECRET.encode(),
    f"{web_chat_id}.{source_id}.{ts}".encode(), hashlib.sha256).hexdigest()
```

2. Pass values to the frontend embed script

```
window.MaiAgent.setupAuth({ sourceId, name, ts, sig });
```

3. Integration notes

Generate a new signature on every entry: each signature can succeed only once. Do not cache it.

Calculate signatures on the backend: exposing the secret in frontend code makes it public.

Keep the clock accurate: the system permits 60 seconds of clock skew; timestamps outside this range are rejected.

Use the correct platform ID: a signature calculated with another platform's ID will fail.

4. Behavior Reference

Incoming request	Result
Source ID + valid signature	Opens the conversation directly without a login screen

Incoming request	Result
Source ID + invalid or expired signature	Rejected
The same signature is reused	First request succeeds; second is rejected
No Source ID (including opening the public URL)	Redirected to the login page
“Source ID only” + Source ID	Opens directly without signature verification
This toggle is disabled	Existing login behavior remains unchanged

All rejection scenarios return the same external response. It reveals neither the reason nor whether a Source ID exists. Reasons appear only in the admin failure log.

5. Signature Verification Failure Log

If integration fails, click [“View Signature Verification Failure Log”](#) in the settings to view recent failures. The log contains neither the secret nor complete signatures.

The expanded signature verification failure log

Reason	Common cause
Signature expired	The server clock is offset, or the embedded client cached the signature
Timestamp exceeds the allowed future range	The server clock is over 60 seconds fast
Signature mismatch (secret may differ)	The backend secret differs, or the signature string is assembled incorrectly
Missing timestamp or signature	The embedded client omitted <code>ts</code> or <code>sig</code>
Signature already used	The same signature was submitted twice
Replay-prevention cache unavailable	Temporary platform issue; the system rejects instead of allowing access
Source ID maps to multiple contacts	Duplicate contacts with the same Source ID exist on this platform

6. FAQ

- ▶ Will the conversation be interrupted when the signature expires?
- ▶ Can one Source ID map to multiple contacts?
- ▶ Will enabling this setting affect existing embeds?
- ▶ Can users continue chatting after signing out of my website?

Citation Source Display

This article introduces the citation display optimization features in the WebChat chat window, including multilingual support and visual presentation improvements.

What Is Citation Display?

When the AI Assistant answers a question using information from specific documents or data in the Knowledge Base, the system displays "citations" below the response, letting end users know where the information comes from.

This feature is especially suitable for scenarios that require source verification, such as:

Regulatory inquiry assistant: Displays the source of legal provisions

Policy consultation assistant: Displays policy document sources

Product customer service assistant: Displays product manuals or official documents

Medical information assistant: Displays medical literature sources

Citation Display Location

Citations appear below the AI Assistant's response content in a clear format:

AI Assistant response content ...

Citations:

- Product User Manual - Chapter 3
- FAQ - Return and Exchange Policy

Multilingual Support

Automatic Language Adaptation

WebChat citation display now supports automatic multilingual adaptation. When end users switch languages, the citation interface text automatically switches to the corresponding language.

Supported Languages

Traditional Chinese: 引用來源、參考資料

Simplified Chinese: 引用来源、参考资料

English: Citation 、References

Language Switch Timing

WebChat automatically switches languages based on the following scenarios:

Browser language settings: On first load, the display language is based on the user's browser language

Manual switch: When users switch languages in WebChat, citation text updates accordingly

Website language environment: If your website supports multiple languages, WebChat automatically matches the website's language settings

For WebChat language configuration, refer to: [Web Chat Overview](#)

Visual Presentation Optimization

In addition to multilingual support, the visual presentation of citations has been optimized for clearer readability.

Optimization Items

Spacing adjustments: More appropriate spacing between citations and response content for clearer visual hierarchy

Font styling: Citations use a different font style to distinguish them from the main content

Color treatment: Citations use lighter colors to avoid interfering with the readability of main content

Icon markers: Unified icons mark citations for better recognition

Dark Mode Support

Citation display also supports dark mode. When end users' devices use a dark theme, the text and background colors of citations automatically adjust for clear visibility against dark backgrounds.

Dark Mode Adaptation Items

Text color automatically adjusts to lighter shades

Background color adapts to the dark theme

Maintains contrast with main content

Dark mode activates automatically based on the user's device settings; no manual configuration is needed.

Practical Use Cases

Government Policy Consultation Platform

Usage scenario:

When citizens inquire about the eligibility requirements for a subsidy policy, the AI Assistant not only provides the answer but also displays the source link to the policy announcement.

Benefits:

- * Increases information credibility
- * Allows citizens to review the full announcement
- * Reduces concerns about information accuracy

Legal Consultation Assistant

Usage scenario:

When users inquire about specific legal provisions, the AI Assistant displays the source and article number of the relevant law.

Benefits:

- * Provides complete legal basis
- * Users can verify the original legal provisions
- * Enhances the professionalism of the consultation service

Medical Information Platform

Usage scenario:

When patients inquire about disease-related information, the AI Assistant indicates which medical literature or health education article the information comes from.

Benefits:

- * Provides information source transparency
- * Helps patients understand the credibility of the information
- * Complies with medical information provision standards

Admin Settings

Enable Citation Display

The citation display feature is enabled by default. To adjust the settings:

Go to the "AI Assistant" settings page

Select "Response Settings"

Find the "Show Citations" option

Toggle the switch to enable or disable

Customize Citation Format

You can add metadata to Knowledge Base documents to customize the citation display format:

Document title: The document name displayed in citations

Chapter number: The specific chapter or page number displayed

Publication date: The document's publication or update date

External link: A link to the original document

For Knowledge Base metadata configuration, refer to: [Document Management: Tags and Metadata](#)

FAQ

Q1: Will citations show all referenced documents?

Not necessarily. The system displays the most relevant citations, typically no more than 3-5, to avoid information overload.

Q2: Can citations be hidden?

Yes. Disable the "Show Citations" option in the AI Assistant settings.

Q3: Can the citation language be fixed to a specific language?

Citations automatically match the WebChat language setting. If you want to fix it to a specific language, you need to lock the language option in the WebChat settings.

Q4: Do citations support clickable links?

Yes. If you have configured external links in your Knowledge Base documents, citations will display as clickable links.

Q5: What if citations are hard to read in dark mode?

The system has been optimized for dark mode. If issues persist, it may be a browser cache problem. Try clearing the cache or refreshing the page.

Markdown Rendering

This article introduces the message content rendering optimization features in the WebChat window, making AI Assistant responses clearer and easier to read.

What Is Message Content Rendering?

Message content rendering refers to how WebChat converts the AI Assistant's text responses into the visual presentation that users see. AI Assistant responses may include:

- Plain text:** General text descriptions
- Markdown formatting:** Headers, lists, bold, italics, and other formatting
- Code blocks:** Code examples or commands
- Tables:** Structured data presentation
- Links:** External links or reference materials

Good rendering makes this content easier to read and understand.

Optimization Items

1. Fully Upgraded Markdown Rendering Engine

WebChat now uses an enhanced Markdown rendering engine that supports richer formatting and more precise rendering.

Supported Markdown Formats

Format Type	Syntax Example	Rendering Description
Headers	<code># Heading 1</code> , <code>## Heading 2</code>	Clear heading hierarchy for content segmentation
Bold	<code>bold text</code>	Emphasizes key content
Italic	<code>*italic text*</code>	Secondary emphasis or supplementary notes
Lists	<code>- Item 1</code> , <code>1. Item 1</code>	Ordered or unordered lists
Inline code	<code>`code`</code>	Inline code or commands

Format Type	Syntax Example	Rendering Description
Code blocks	code	Multi-line code with syntax highlighting support
Tables	Column 1 Column 2	Structured data display
Links	link text	Clickable hyperlinks
Blockquotes	> quote content	Quotations or special notes

2. Dark Mode Visual Optimization

When end users' devices use a dark theme, WebChat automatically adjusts the visual presentation of message content to ensure clarity and readability on dark backgrounds.

Dark Mode Adjustments

- Text and background contrast:** Automatically adjusts text color for clear display on dark backgrounds
- Message feedback buttons:** Adjusts button colors and borders to remain visible in dark mode
- Table visuals:** Adjusts table borders and background colors for improved readability
- Blockquote backgrounds:** Adjusts blockquote background tones to differentiate from the main content

3. Streaming Rendering Performance Improvements

WebChat uses real-time streaming to display AI Assistant responses, so users don't need to wait for the full response to be generated. This update optimizes streaming rendering performance:

- Faster rendering:** Markdown formatting renders more quickly, reducing perceived latency
- Improved smoothness:** Text appears character by character more smoothly, with no noticeable lag
- Format accuracy:** Markdown formatting renders correctly even during the streaming process

Users can see the already-generated content in real time while the AI Assistant is still composing its response, without waiting for the complete answer.

Practical Use Cases

Technical Documentation Assistant

Scenario:

When developers ask for code examples, the AI Assistant provides responses with code blocks.

Optimization Effects:

- * Code blocks support syntax highlighting for easier reading
- * Code displays clearly in dark mode
- * Developers can directly copy and use the code

Example Response:

Here's an example of reading a CSV file in Python:

```
python
import pandas as pd

df = pd.read_csv('data.csv')
print(df.head())
```

This code reads a CSV file and displays the first 5 rows.

📊 Data Analysis Assistant

Scenario:
Users ask for sales data analysis results, and the AI Assistant presents them in table format.

Optimization Effects:

- * Tables are clearly formatted with aligned columns
- * Table borders and background colors adapt to dark mode
- * Large datasets remain readable

Example Response:

Here are the top three selling products this quarter:

Product Name	Units Sold	Revenue
Product A	1,250	\$125,000
Product B	980	\$98,000
Product C	856	\$85,600

Sales data as of the 20th of this month.

📖 Teaching Assistant

Scenario:

Students ask about learning steps, and the AI Assistant explains using an ordered list.

Optimization Effects:

- * List items are clearly numbered
- * Heading hierarchy is distinct, making step order easy to follow
- * Key content is emphasized with bold text

Example Response:

Recommended Steps for Learning Python

Basic Syntax

Variables and data types

Conditionals and loops

Advanced Concepts

Functions and modules

Object-oriented programming

Hands-on Practice

Complete small projects

Contribute to open source

Each step is recommended to take 2-3 weeks of study.

Administrator Settings

Markdown Rendering Settings

WebChat's Markdown rendering is enabled by default. If your use case doesn't require Markdown formatting, you can adjust it in the settings:

Go to "Publish" → "WebChat Settings"

Find the "Message Rendering" settings section

Select the rendering mode:

Full Markdown: Supports all Markdown formats (default)

Basic formatting: Supports only bold, italic, and links

Plain text: No formatting rendered

Dark Mode Settings

Dark mode activates automatically based on user device settings. If you want WebChat to use a fixed light or dark theme:

Go to "Publish" → "WebChat Settings"

Find the "Appearance" settings section

Select the theme mode:

Auto: Based on user device settings (default)

Light: Always use the light theme

Dark: Always use the dark theme

For detailed WebChat appearance settings, refer to: [Connect Chat Platform: Website](#)

Performance Impact

Rendering Performance

Performance impact of the optimized Markdown rendering engine:

Load time: First load increases by approximately 0.1-0.2 seconds (virtually unnoticeable)

Memory usage: Increases by approximately 1-2 MB (minimal impact on modern browsers)

Rendering speed: Approximately 30% faster compared to the previous version

Compatibility

The optimized rendering engine supports the following browsers:

Chrome

Edge (version 90+)

Firefox (version 88+)

Safari (version 14+)

Mobile browsers (iOS Safari, Android Chrome)

Older browser versions may not correctly display some Markdown formats. It is recommended to prompt users to update their browsers.

FAQ

Q1: Why doesn't my AI Assistant's response have formatting?

Possible causes:

- * The AI Assistant is not using Markdown syntax
- * Markdown rendering is disabled
- * The browser version is too old

Q2: What if some content is hard to read in dark mode?

Try the following:

1. Clear the browser cache
2. Refresh the page
3. Ensure you are using the latest browser version

Q3: Can I customize the syntax highlighting colors for code blocks?

Currently, syntax highlighting colors are fixed. Future versions may support customization.

Q4: How is long table content displayed?

Tables automatically support horizontal scrolling to ensure complete content display without affecting the layout of other content.

Q5: Will rendering optimization affect display on mobile devices?

No. Rendering optimization has been adapted for mobile devices to ensure clear display on small screens as well.

MaiGPT Window Mode Embed

In addition to the common "floating button in the bottom-right corner," MaiAgent's Web Chat SDK introduces **MaiGPT window mode**, which lets you embed a **full ChatGPT-style conversation interface** (conversation history list on the left + main conversation area on the right) directly into any position on your page as the primary UI, rather than a small widget tucked in a corner.

This page explains "how to embed MaiGPT window mode on your website." If you have not yet created a Web Chat platform, please refer to [Integrate with Platform: Website](#) to complete the basic setup first.

Where to Start? Get the Embed Code

The embed code on this page is obtained from [Basic Settings](#). Follow the steps below:

Access the Chat Platform Settings

Go to "[Customer Service > Chat Platforms](#)", select your Web Chat platform, and click "[Operations](#)" to enter the settings page.

Click "Embed"

In [Basic Settings](#), find the Public Access URL section and click the "[Embed](#)" button to open the embed window.
